When the railroad came into existence, two generations ago, the effort to secure good common roads in America was abandoned, because it was fancied that with the development of the railroad the common road would not be needed. But experience has shown that the greater the travel on the railroads the greater the travel on the common roads, and hence that the latter are really a greater necessity than ever. And we will learn the same lesson from the extension of the trolley system, for travel begets travel. How unwise it will be, therefore, just as we are on the eve of securing for ourselves and our children a good system of country highways, to give them over to these private corporations for a use quite foreign to that for which we improved them!

Electric Furnace.

Much space is given in the *Comptes Rendus* to a description of a continuous electric furnace in which materials may be melted out of contact with the carbon vapor of the air. The body of the furnace is constructed of bricks of lime surrounding a central cavity, the sides of this cavity being lined with alternate plates of carbon and magnesia, the latter being next the lime, as, if the carbon plates were in contact with the lime, combination would occur at the high temperatures reached, liquid calcium carbonate being formed. The magnesia plates are irreducible by carbon, and therefore can only waste away by direct volatilization. The cavity is closed with simple plates, above which is placed a block of lime. The arc carbons pass through opposite walls of the furnace, and the arc is struck between tbem in the center of the cavity; below tbe arc and above the bottom a tube of pure carbon, one or two centimeters in diameter, passes through the furnace from side to side, and is inclined at an angle of thirty degrees to tbe horizontal. The ores to be fused are placed in this tube and the arc struck, the metal as reduced flowing down to the lower end of the tube, where it can be collected. Using a current of 600 amperes at 60 volts, an ingot of chromium of two kilogrammes weight has been produced; the fused metal was cast in molds of sesquioxide of chromium, to which it gave up any carbou it originally contained. The heated part of the carbon tube is transformed into graphite.

Poor Carbons.

There is probably no one thing connected with electric lighting so unsatisfactory as the carbons with which the market is generally supplied, and the improvement in them has by no meaus kept pace with that in the lamps in which they are burned. Perhaps the cause for this lies in the fact that the physics of the voltaic arc is so little understood. If it were clearly proven that the carbon was actually volatilized, or that it was simply carried from the positive carbon to the negative mechanically, and rendered incandescent during its passage, the makers would have a definite aim in their selection of materials and methods of manufacture.

THE largest use of electric light is by far that made in the United States, but the methods of production and utilization in use here do not appear to be quite so economical as those practiced abroad, says an exchange. The plants throughout Europe are generally on a much more modest scale tban here, except in a few such cities as Berlin, Hamburg and Vienna, yet recent statistics show that some of tbe smallest are competing successfully, not only with long-established gas works, but with petroleum. Very little of the current, however, is used for power purposes, and conveniences like the fan motors now running daily by the hundred thousand in the United States are well nigh unknown, so much so tbat when needed they are shipped from New York. In Berlin 19.9 per cent of the current is employed in lighting dwellings and hotels, but in Hamburg the same item runs up to 38.7 per cent. Store lighting in the larger German and Austrian cities averages 30 per ceut of the current. Berlin and Vienna use much less than 10 per cent of the current for driving motors in factories, stores, etc. Exceedingly little use is yet made of the current for heating. A large proportion of the stations have storage battery equipments; in this country this auxiliary is almost unheard of in central station operation, though nobody appears to know why.

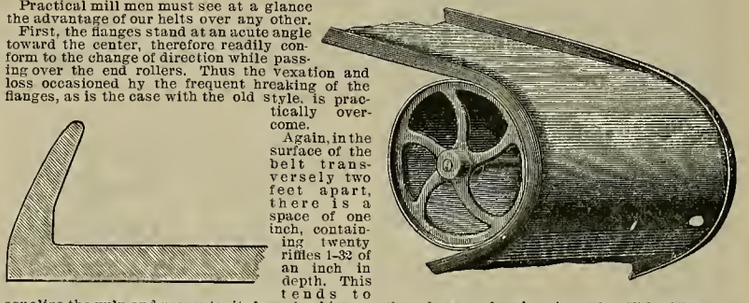
Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machinos, and make all lengths and widths to order.



Practical mill men must see at a glance the advantage of our helts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned hy the frequent breaking of the flanges, as is the case with the old style, is practically overcome. Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from hanking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escapo with the tailings from a helt with an entirely smooth surface.

H. G. BLASDEL, JR., Manager,
419 California Street, Haywards Building ..... San Francisco.

Mining Pipe!

STEEL OR IRON.—We mako pipe of either, but recommend STEEL, it heing superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.
COMPETITORS.—Our competitors say we have the hest appointed Pipe Shop on the Coast.

Double Acting Cornish Plunger

Pumps twice as much water as the old Cornish pump and "only one-third the weight."
SPECIAL CONSTRUCTION OF STEEL for packing on mules, only one-twelfth the weight of the ordinary Cornish Plunger.

IMPROVED SINKING PUMP.

Bucket and clack changed under water, saving expense of putting down another pump when the bucket or clack gives out under water. Bucket gearing lasts six times as long as the old gearing.
First outlay one-third less and works with ten per cent less power, "paying for itself in one or two years, according to the price of fuel."

WM. NANCE.....Grass Valley, Nevada County, California.

Practical Information.

Ball Bearings for Wagons.

Ball bearings are successful only when the balls themselves are of the highest quality, and the shells and axles are of the best steel, hardened and ground to the highest perfection, writes Prof. Sweet, in the *Rural New Yorker*. The limit of error in the best does not vary more than one-quarter of one-thousandth of an inch, or one-fourth the thickness of tissue paper. Such perfection is very costly, and the least dirt destroys the whole gain, for if the balls be stopped by any impediment, they are very soon ruined. Such accurate work is not likely to be properly protected or properly cared for in farm vehicles. Hence it is questionable whether the failures would not more than overbalance the advantages; besides, in the cost of drawing a load, a part is friction and a part is overcoming the ground resistance. The poorer the road the greater is the ground resistance, and this has a great bearing on the percentage of advantage, for supposing that, in the case of a trotting sulky, the friction is half the resistance and the ground resistance is the other half, now, if we reduce the friction one-half, the power required to draw the sulky would be reduced one-quarter or tweuty-five per cent; whereas if, in drawing a lumber wagon, the friction is ten per cent and the ground resistance ninety per cent—which on a farm and farm roads is about what it amounts to—then, by reducing the friction one-half, we have reduced the actual power required only five per cent. The time has not come when it will pay. It will be an infinitely better investment to use the same money to put wide tires on the wheels and cut off the front axles so as to bring the forward wheels the width of the tires nearer together than the hind ones. I have just been over a dirt road where 100 tons of limestone are drawn every day, aud the ruts were horrible when only common wagons were used. The road is now splendid, all owing to the use of half the number of wagons built as above described, while the ball bearings could at the best reduce the power to draw farm wagons only from five to ten per cent. The wide tires and short-axle wagous would reduce the cost of hauling on the farm roads forty to fifty per cent, aud the cost of the changing to ball bearings would equal the cost of the new wheels and front or back axles.

The Swiss Watch Schools.

The school the writer visited is the extensive one at Geneva. Being provided with the requisite permission, and escorted by an "alumnus" of the institution, he was shown every courtesy and afforded every opportunity to observe.

One is first ushered into the beginners' room. To enter, a boy must be at least fourteen. He will first be introduced to a wood-turning lathe and set at turning tool handles. He will be kept at this from eight days to several weeks, according to aptitude. Then he will be advanced to the work of filing and shaping screw-drivers and similar tools. These, and all other tools which he may afterward make, will be his own. Being, iu course of time, to some extent provided with tools, he will undertake makiug a large wooden pattern of a watch frame, perhaps as large as a dining plate. After he has learned just how this frame is to be shaped, he is given a ready-cut one of brass of the ordinary size, and he begins drilling the holes for the wheels and screws. All along the master stands over him and iustructs him. The circular pieces of brass which are put into his hands here he will go on with, and when the watch is completed that, too, will be his own.

He is then taught to make other fine tools, and to finish the frame, ready to receive the wheels.

Then he will leave the first room, and pass up into one where he is taught to fit the stem-winding parts, and to do other fine cutting and filing by hand, to make watches that will strike the hour, minute, etc., for which class of work the Swiss are so famous. One can readily conceive how exceedingly minute and exact such workmanship must be, particularly on the minute snail—that is, the guide which permits and arrests the striking, so that, in addition to the hour and the quarter, the very minute shall be sounded.—Theodore B. Wilson.

The Manufacture of Steel Tapes.

While the knowledge of the main processes in connection with the manufacture of steel tapes is regarded as a trade secret, the following particulars, which are of a general character, will be of interest. After the rolled ribbons have been tempered and ground, in quantities of from one to two dozen at a time, they are laid upon an iron table fifty feet loug, which has a standard on each side. The standards are of Government length at 62° Fahr. The ribbons, placed on this table in lines parallel to the standards, are made fast at one end, and a strain of twelve pounds under a spring balance is applied at the other. They are then printed with a wash or varnish not affected by acid, and then etched in a diluted nitric acid bath—the graduation being covered by the wax is left in the original surface of the tape.

BRASS work does not usually hold well on a taper steel arbor, but a thin film of chalk or three light chalk-marks about evenly spaced will help materially, and not affect the truth of the work to any appreciable exteut.

PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St., S.F.

Market Reports.

The Markets.

SAN FRANCISCO, Nov. 15, 1894.

It was thought that the Chinese loan of £1,000,000 in London would favorably influence silver, but the subsequent sale of the loan at a small discount, and the fact transpiring that the net amount will he wholly used in the payment for war material hought in Eurcpe, did not tend to strengthen the market, which was almost stationary throughout the week.

New York Prices.

Small profit is reported on Australian coal this season. It costs 8s in Australia, 14s freight, duty 40 cents, insurance 1 to 1½%; these are cited as causing it to cost about $6 a ton here. It is probahle, however, the stated freight rate possesses sufficient elasticity to justify a revision of the totals.

Mining Share Market.

SAN FRANCISCO, Nov. 15, 1894.

Shares held up during the week and shorts are not happy. The Con. Cal. & Va.'s $54,000 dividend and the probability of another dividend from the Bodie Con. were felt. Hale & Norcross advanced, though why no one seemed to know. Favorable reports are received from the new strike in Ophir. The drift is now almost to the north boundary of the Con. Va. The latter reports a cash balance of $230,276, with all the expenses for October paid. After paying the $54,000 dividend, there remains $186,276.55 in the treasury.

The Nevada mill has closed down for two weeks. The Morgan mill started up again yesterday.

The Palmetto group of mines in southeastern Nevada is reported sold to an English syndicate who, it is expected, will put in reduction works next spring. The ore is free milling gold.

The following illustrates the changes of the week:

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Colorado Mining Incorporations.

The following are among the most recent Colorado mining incorporations:

The Giles Mining and Milling Company. Capital stock, $250,000. Directors—George A. Tenny, M. L. Luebhen, Theodore Miller, H. F. Luehhen and J. H. LcClair. Object, to operate in Boulder county.

The Ferrum Mining Company of Lake county. Capital stock, $500,000. Directors—W. L. Thompson, G. E. Taylor, J. A. Ewing, R. B. Estey and C. T. Limberg.

The Iron City Mill Company of Gilpin county. Capital stock, $50,000. Directors—Lyne S. Newell Jr., S. V. Newell, F. Givvener Jr., and William Jacoh.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN MAKING MACHINE.—Robert D. Hume, Gold Beach, Oregon. No. 528,673. Dated Nov. 6, 1894. The object of this invention is to provide a machine for making can hodies from the flat sheets of metal and applying the heads thereto in a single continuous operation, and in conjunction therewith of an automatic feeding mechanism by which the sheets of metal are successively delivered to the machine wherein they are bent into shape, side seams formed thereon, said seams interlocked, closed and soldered. It consists of a feeder hy the pneumatic action of which sheets of tin are lifted from the tahle upon which they are placed in a pile, and delivered thence to a poiut where they are seized hy carriers and reciprocated horizontally along the horn, around which they are gradually shaped into cylindrical form, having hook-shaped flanges formed upon the edges, and mechanism hy which these edges are iuterlocked and closed, a soldering mechanism over which the closed seams are passed so that the solder is applied to the seams, and a mechanism at the end wherehy the prepared heads are applied and crimped upon the end of the can body in readiness for soldering.

UNION OF TRANSVERSE METAL BARS.—John T. McCormick, Sau Francisco. No. 528,677. Dated Nov. 6, 1894. The object of this invention is to provide a means for rigidly uniting bars which cross each other transversely so that they may form either grills, gratings, door-mats, fences or other structures. It consists in arranging sets of hars having plain untwisted portions between the adjacent twisted portions with the other series extending at right angles through slots in the untwisted portions of the first named bars, so that the twisted portions upon each side of the slots form locks to secure the hars together with the edges of hoth sets of hars uppermost at intervals.

CARD CATALOGUE.—A. J. Rudolph, San Francisco, Cal. No. 528,692. Dated Nov. 6, 1894. This invention relates to improvements in what are termed "card catalogues." It consists in such a construction of the independent movable card adapted to stand on edge that it shall have one of its sides smooth, flat and ruled, and its opposite side recessed at points inside of its marginal lines sufficiently to receive a slip which is pasted therein, whereby the surface of the slip will not project heyond the plane of the face of the card.

BINNER FOR BOOKS AND PAMPHLETS.—A. J. Rudolph, San Francisco, Cal. No. 528,693. Dated Nov. 6, 1894. The object of this inveution is to provide a means for hinding abstracts, pamphlets, periodicals and other hooks in circulating libraries so as to produce a more compact and stronger hook, so hound that when spread out for use the several sections will lie suhstantially flat without any gah at the back. It consists of rigid channel plates adapted to receive and hold the edges of the parts to he used, hinge hands passing through them and a hinge section which are united together heyond the edge of the parts, flexihle channel pieces secured to the parts to he bound, retained in place within the rigid channel pieces extending heyond the edges thereof, and supplemental hent plates fitted into the hottom of the channel sections with holes to receive the hinge rods aud retain them in central position within the channels. It also comprises flexible protecting strips and a means for attaching the name, lahel or index upon the rear of the hinding so that it will he exposed when the book is complete and closed.

Notice of Assessment.

GARNER CONSOLIDATED GOLD MINING COMpany. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of October, 1894, an assessment, No. 1, of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 56, No. 3 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of December, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, 309 Montgomery St., Room 56, San Francisco, California.

NOTICE OF ASSESSMENT.—OCCIDENTAL CONsolidated Mining Company: location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey Co., Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the first day of November, 1894, an assessment, No. 13, of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth day of December, 1894, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

ANNUAL MEETING.—THE REGULAR ANNUAL meeting of the stockholders of the Occidental Consolidated Mining Company will be held at the office of the company, room No. 69, Nevada Block, No. 309 Montgomery street, San Francisco, California, on Monday, the 19th day of November, 1894, at the hour of one o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, November 16, 1894, at 3 o'clock P. M.

ALFRED K. DURBROW, Secretary.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from E. P. Hagar & Samuel Peck in the U. S. Grant Mine, near Blue Tent, Nevada Co., Cal., to impound tailings behind brush dam in ravine below the mine; from John Black in the Spanish John Mine, near Rough & Ready, Nevada Co., Cal., to impound tailings behind brush dams in blind ravines and pit; from the Good Hope Mining Co., in the Richmond Hill Mine, near La Porte, Plumas Co., Cal., to impound tailings behind log and crib dam in Onion Valley Creek; from Leonard Dormody in the Martelle Mine near Salmon Falls, El Dorado Co., Cal., to impound tailings behind dams in Martelle Creek; from J. M. Read & N. E. Beckwith in the Pine Grove and Hidden Treasure Mines, near Pine Grove, Amador Co., Cal., to impound tailings behind brush dams in Saw Mill Gnich and behind log and rock dam in Grass Valley Creek; and from the Gold Run Ditch & Mining Co., in the Gold Run Mine, near Dutch Flat, Placer Co., Cal., to impound tailings behind a rock filled dry masonry dam, 100 feet high, in the North Fork of the American River, about 2 miles above its junction with the Middle Fork, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Nov. 26, 1894, at 1:30 P. M.

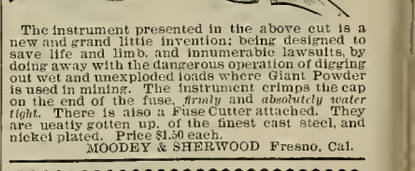
FOR SALE OR EXCHANGE.

Mill returns show up to $30 in gold and over $115 in silver per ton. House, materials, tools, etc.; no plant. Sell cheap to close the estate of late owner, or exchange for acreage or city property in South California at $7000. J. B. BAINBRIDGE, 230 West First St., Los Angeles, Cal.

GIANT POWDER FURE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

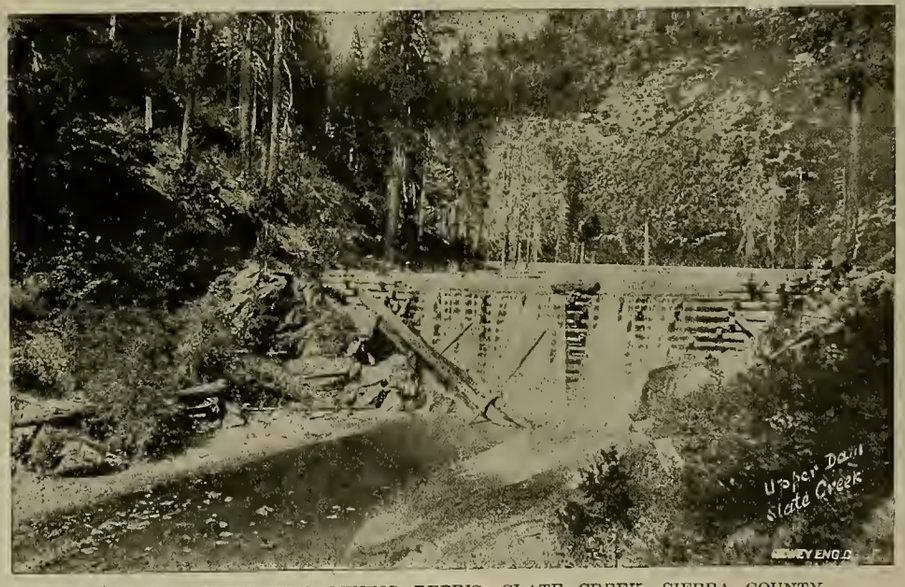
Debris Dams.

As is generally understood, under the provisions of recently enacted laws, all hydraulic mines operated in the drainage basins of the Sacramento and San Joaquin rivers must impound their debris behind dams or other restraining works constructed at their own expense. Even before the passage of these laws, some of the mines, to obviate injunctions of the courts, constructed such dams, two examples of which are given on this page. The original photographs from which these pictures were made were obtained by Major W. H. Heuer of the U. S. Debris Commission, who is quite an accomplished amateur photographer. The larger dam is one on Slate creek, in Sierra county, and shows the deposit of debris behind the barrier. The smaller dam is on Rock creek, in the same county.

DEBRIS DAM ON ROCK CREEK, SIERRA COUNTY.

While these two dams were built before the passage of the Caminetti law, they are of a similar nature to those now being constructed under the provisions of that law. A narrow gorge or canyon is naturally selected as a site, and as the reservoir fills up, the dam is increased in height. The debris collecting in these reservoirs soon becomes compacted or cemented in a mass, and even should a dam break, there is no danger from any sudden irruption of water below, since spill-ways are provided so that the water may be constantly passing off and only the debris remains behind the dam. In this way no large bodies of water can collect behind the dams, which, therefore, need not be of a very permanent nature. Some of the log dams for this purpose put up twenty years or more ago are still in a good state of preservation, and the material behind them has been practically cemented into a solid, compact mass.



DAM FOR RESTRAINING MINING DEBRIS, SLATE CREEK, SIERRA COUNTY.

ALMOST our entire space this week is devoted to the proceedings of the Miners' Convention, and even then we are not able to conclude the account this week. It has been the aim of the MINING AND SCIENTIFIC PRESS, however, to give the proceedings in full because the 300 or 400 delegates present only represent one in ten of those interested in what took place. Through our columns those who had to remain at work in the mountains may read fully what was done. It is only to be regretted that the enthusiasm and energy everywhere apparent cannot be also reproduced.

THAT splendid and complete banquet at the Palace Hotel, given to the miners by the merchants, manufacturers and bankers of San Francisco, will be a topic of discussion for months up in the mountains of California. No handsomer compliment was ever paid to the representatives of any industry by the business men of this city.

THE little silver badge, representing a crossed pick and shovel, worn by all the delegates to the Miners' Convention, was the happy idea of Secretary Ralston and was in great demand even from those not delegates.

The Banquet to the Miners.

The banquet tendered to the delegates of the Miners' Convention by the merchants, manufacturers and bankers of San Francisco at the Palace Hotel on Wednesday evening was a very enjoyable affair both to hosts and guests. Some 300 were present, and addresses were delivered on the part of the entertainers by Wm. Watkins, President of the Board of Trade; Mayor-elect Adolph Sutro, Congressman James G. Maguire, A. S. Hallidie, Irving M. Scott and Andrew Carrigan; and on behalf of the miners by J. H. Neff, President of the California Miners' Association; Judge Niles Searles, S. K. Thornton and Chas. G. Yale.

The banquet was a high compliment to the miners of the State and shows the appreciation in which the industry, as represented by the California Miners' Association, is now held by the foremost business men of this city. It is a thorough and the best proof of the complete change of sentiment which has taken place in connection with this branch of industry during the past few years. Here were the foremost merchants, manufacturers and bankers of the metropolis entertaining at an elaborate and expensive banquet the hardy miners from the mountains of California, and assuring them by word and deed of their great interest in all that would advance the miners' cause.

The compliment was one which was highly appreciated by the representatives of the mining industry present, and should be by all connected with it throughout the State. It augurs well for the future of mining in California when such a body of representative men see fit to pay such unsolicited and complimentary attention to the miners of the State.

MANY of the speakers who were not miners, who came before the convention, expressed the conviction that gold mining was now the most prosperous industry in this State, and one which but needed the investment of capital to almost double its annual product within a few years.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Debris Dam on Rock Creek, Sierra County; Dam for Restraining Debris, Slate Creek, Sierra County, 331.
EDITORIALS.—Debris Dams; The Banquet and the Miners; Miscellaneous, 321. The Cyanide Process Decision; Miscellaneous, 323.
MISCELLANEOUS.—The Miners' Convention, 322-23-24-32-33. Mineral or Agricultural Character of Land, 325-26. Department Rulings and the Miners, 328. Delegates to the Miners' Convention; The Nicaragua Canal, 330. Notices of Recent Patents, 332. Concentrates, 336.

THE re-election of the old officers of the California Miners' Association was a deserved compliment, as they have all worked hard in their respective fields and are familiar with the proper way to conduct the organization.

THE Astronomical Society of the Pacific holds a regular meeting in the rooms of the Technical Society of the Pacific Coast, 819 Market street, this evening at eight o'clock. Papers by Professor Holden, W. H. S. Mouck of Duhlin, Roger Spragne of Denver, Professor M. McNeill of Lake Forest, Messrs. Schaeherle, Barnard, Campbell, Tucker and Perine of the Lick Observatory, Mr. Burckhalter of Oakland and F. R. Ziel of Alameda, will be presented. The meeting is open to the pnblic.

THE PRESS is informed by Mr. P. George Gow, California and Nevada agent for the MacArthur-Forrest cyanide process, that the decision recently rendered in Londou was in the High Court of Justice, from which an appeal has been taken to the House of Lords, where he has reason to believe, from news received from London, that the decision will be reversed. He further states that the decision can in uowise affect American patrons, and in any event this suit only applies to the gold dissolving process, and not the precipitation patent.

AFTER readiug the accounts of the Miners' Convention in the daily papers iu the city, which gave extended space to the proceedings, some of those few anti-debris agitators who have gained notoriety in that cause, ought to realize the change of sentimeut among the people in connection with mining in California. The standing of those who came before the convention and addressed it, and of those who entertained the miuers at the banquet on the conclusion of the proceediugs, should he sufficient warrant that the best and most influential people of this State are anxious to see a more geueral resumptiou of gold mining in this State, and willing to do all they can to aid it.

THE proceedings of the Fourth State Miners' Convention, held this week, were harmonious in every respect. This convention was the most successful one the miners have had, and much good will result from it. There was a full representation from the mining counties, and the members were addressed by the Governor of the State, the Governor-elect, a United States Senator and several Cougressmen, as well as hy many prominent men connected with the miuing industry. The main topics of discussion related to desired changes in the mining laws of this country, and those suggested will he found in another column. We print in full the proceedings of the convention as far as our space will permit, and will give the conclusion in our uext number. We shall also print next week the technical papers read. The convention was in session for three days, dnring all of which time the greatest interest was manifested in the proceedings.

THE MINERS' CONVENTION.

Proceedings of the Annual Meeting of the California Miners' Association.

The Speeches, the Resolutions and the Suggested Changes in the U. S. Mining Laws.

The California State Miners' Convention met at San Francisco on Monday, Novemher 19, 1894, at the Metropolitan Temple. The convention was called to order hy President Neff who opened the proceedings by saying:

Gentlemen of the Miners' Association of California:—In entering upon the discharge of our duties as delegates to the Miners' State Convention, it affords me pleasure to say to you that, since our last meeting, such progress has been made in the cause of the miners that to-day prosperity heyond our expectations reigns in the mining counties of this State. We do not feel the depression of hard times there as our friends do who reside in the agricultural or horticultnral districts. It was stated when this organization first met in convention here that it was for the purpose of hringing together the miner and the farmer; to bring ahout a better understanding hetween the two old industries of the State. Onr friends of the valleys are now our friends, indeed; litigation between the miner and the farmer has ceased to a great extent, and each one is pursuing the trend of his calling industriously and honestly.

It has always heen a source of pride to me that the miner has been and is a law-ahiding citizen; that, although laboring under what they thought to be a great wrong, they have always submitted to the decrees of court and abided hy its decisions. I do not propose to detain you with any extended remarks. The litigation that has been had, through the Miners' Association, is a matter of history to the whole people. A great deal more is to he accomplished. The time has not yet arrived when this association can afford to dissolve. Every man who is honestly and fairly imhned with the spirit of conducting this association fairly between man and man, and in the interest of the great industry of mining, should lend a helping hand and press forward and aid ns in the discharge of our duties.

The first husiness in order will he the appointment of a Committee on Credentials. A motion will uow he entertained.

MAJOR MCBRIDE: I move that the Chair appoint a Committee on Credentials of fifteen memhers. This motion was duly seconded and carried.

THE CHAIRMAN: The Chair desires to state that it will require a little time for the formation of that committee, and as Governor Markham has kindly consented to deliver an address, the proper time to hear him would be uow. I desire to say to the convention that after the address from Governor Markham, he will hold a short reception here and every delegate can come and shake hands with the Governor of the State of California. It is scarcely necessary for me, gentlemen of the convention, to say that I take great pleasnre in introducing to yon Governor H. H. Markham.

Governoi Markham addressed the convention as follows:

Mr. President, Friends, Members of this Convention:—This is indeed an unexpected pleasure for me, for when I was first invited to come here and meet you, I felt that it would be impossible. I had been from my office for nearly ten days and I knew what that meant when I should return and find my table and desk a foot deep with debris. I did feel, perhaps, that the Chairman would delegate some good honest miner to help me make a general cleanup. I will say, however, that after listeuing to the eloquent appeal that was made to me by your secretary, Mr. Ralston, who described to me the manner of man that would be here and the objects of this convention, that I began to feel interested, and the longer he talked, the more I felt like coming. And, gentlemen, here I am.

When I asked Mr. Ralston what I should say in my speech if I made one, he said: "You can say almost anything; just welcome the friends from abroad and say a kind thiug to our owu people, and tell them what California bas done by way of producing the precious metals, and tell them how much every one of us would desire more of each commodity than we now have, and that will answer the purpose." He talked for pretty nearly half an nour, and he delivered a splendid speech to me. With your permission, I will recite it to you.

I will say, however, to you that I have left my work and come here without the slightest preparation. I feel sorry for it, because you are entitled to more of a speech than will be possible for me to deliver to you. I have been kept too busy. I got up at four o'clock this morning and I am here. I have got to return again to-night. I will say to you, gentlemen, that no organization in this State would induce me to do more than I have done to come here, and I would not attempt to deliver a speech to you at this time did I not know that the heart of the miner is always charitable.

Now, my friends, I have no authority to speak for this city, but I will say to you that I am satisfied that your stay here will be made pleasant and agreeable and that your session will be made profitable here in San Francisco, and that the people here will take care of you, and we all know what that means in San Francisco. San Francisco's reputation in that regard is world-renowned. No city in the world has a better reputation in that respect than San Francisco; and, Mr. Chairman, what could be more appropriate than the holding of this kind of a convention in this kind of a city and with this kind of people?

Who came here first? Who laid the foundation for this magnificent city and gave her the name and fame of the metropolis of the Pacific coast? It was the miuers. Where is there a city or a people that have been truer friends or kinder to the miner than San Francisco and its people? Mr. Chairman, San Francisco has been the home of the miner, the friend of the miner, and, I might almost say, the product of the miner. The miner has furnished to this city a wealth of brain, of intelligence, of enterprise, of hospitality, of kindness and friendship that is exceeded by no State in this country. I know, Mr. Chairman, that I have been charged with being a friend of the miner. I will neither deny or affirm that accusation at this time, but I will say that if I am a friend of the miner every one of you are equally guilty.

In my inaugural address to the Legislature four years ago, I called the attention of that body and of the people of California to the question of mining in this State. In my welcoming address to the Chief Magistrate of this nation, I modestly called his attention to the mining interests of California. In my speech at the World's Fair last year, I said concisely what I felt in regard to the mining interests of California, and if you will bear with me I will repeat it to you here. It is in better language and more concise than I could possibly give it without calling your attention to it especially. I think I can repeat it without my glasses, but I may make a mistake, and if you will excuse me I will look at it just as I did that time. This is what I said to the people at the World's Fair (referring to memorandum.) What I said was for the purpose of instilling into the minds or the people of the United States what California has done for the welfare of this whole country and what I think the whole country could now afford to do to assist us in mining in California—and this is what I said:

"While we are all proud of the financial standing of this nation, California must be credited with furnishing the gold and saving the country in her direst need. And let me say right here that three-fourths of that gold was taken away without yielding to California a farthing to show for it so far as her internal wealth was concerned. In fact, but a small portion of it was left to California for the exclusive use of California. Yet it saved the financial credit of the nation and placed her in the prosperous condition which she occupies to-day. The nation is welcome to it, for California can still keep house without it, and she is able to continue doing these charitable acts with her usual becoming modesty.

"Between the years 1848 and 1878, California produced for the use of this country $1,185,550,000 in gold, and since 1878 she has produced $230,000,000. In addition to this, she has produced many millions in silver, all of which has contributed to the financial interests of this whole country. It is safe to say that locked up in her hills to-day, awaiting the action af the Federal Government to aid us in its extraction, we have as much gold as has already been taken out, and I am convinced that this Government can resort to no means so speedy, certain and economical to furnish it with gold and restore its depleted treasury as to permit the hydraulic mining now enjoined by the Federal courts to be carried on with proper engineering safeguards so as not to destroy the agricultural and horticultural industries. It can be done and it will be done, and this country must so earnestly undertake the work as a national enterprise and carry it to a successful conclusion."

Gentlemen, that is what I said to the people of the United States; I will not take back one word of it to-day. In my address to the President when he reached here, I said to him in the course of my remarks that if the gold deposits of California belonged to either France, England, Germany or Russia, those nations would take hold of it as a national enterprise and lend a hand to the miner, for its extraction. I said to him, why should uot America do tbe same thing? I am told by your secretary that the Australian Government is expending vast sums of money to assist her miners in the development of her mines. I am told by him that other countries are doing precisely the same thing, while here in America our Goverumeut is not lifting a hand to assist them—and why not? The last Congress was in session, in extra session and regular session, nearly a whole year. We all know that it costs this Government about $33,000 a day to run Congress. You may not have figured it up, but I have. Nearly $33,000 a day in costs to run Congress, and all we received from that body to assist the mining interests of California was $15,000—less than half a day's pay for running Congress; or let me put it so that you never will forget it: When I say to you, the sessions of Congress are from twelve o'clock noon until five o'clock in the afternoou, making five hours, you can readily see that the cheapest orator in Congress, that talks two hours, costs the Government more thau they have done for us in our mining, so far. Now, my friends, I sincerely believe that with a united, earnest, intelligent, determined effort, you will succeed in getting some money out of that body to assist, or you ought at least to get as much as our friend Senator Ford induced the State of California to appropriate, $250,000. This is not an unnatural request to make of the National Government. The National Government has always insisted on exercising a pareutal care over our mining lands and our mining industries. She is exercising a jealous care to see that no one got an acre of mining land who did not pay twice for it what he ought to pay for auy other land. Therefore I say to you that by assisting in the production of gold in California she is establishing no extraordinary precedent, no legislation, no helping of any particular class or any particular locality. If she assumed to control the mining lands of this country, tben what is the harm in her coming forward and doing those things which will allow the miners to extract the gold tbat we know is locked up in our hills. It is estimated that it costs the Government or the people of this country at least $100 worth of commercial energy to obtain $5 net in gold for any commercial transaction with a foreign nation. Now, if that be true, there is not a miner here who will uot take a contract with the Government of the United States to give them five times that in gold if they will put up the $100 to help him out.

I realize the fact, my friends, that many people imagine that this is a work which is impossible—too gigantic—that it can never be accomplished. Now, I will not assume to say to you that this can be accomplished—I mean the practicable working of it; that I have never assumed to state, but I do know tbat with 70,000,000 of American people and their intellects that they can, out of that mass, devise some means that will do this work, and do it satisfactorily. We do know tbat the National Government, by engineering skill, has reservoired the waters at the head of the great Mississippi river so as to equalize its flow and promote navigation. We do know that the National Government, through engineering skill, has controlled the deltas at the mouth of the Mississippi and made that portion of that great system safe for navigation. That being the case, I say to you that the problem of handling tbe mines of California is no more difficult than the latter, and that if we can enlist the earnest support of the people of this country it will be done, and I hope to live to see it accomplished.

I am afraid that I am detaining you too long (cries of "Go on, Governor").

I will say, as your chairman has said to you, that the first visit I made into the mining countries four years ago as I passed from town to town, and place to place, and there saw the depression, saw the consternation and the sorrow that surrounded every little hamlet almost in the mountains, that it excited my sympathy; and as I said to your presideut, if I had found them prosperous, I perhaps should never have thought of doing anything extra for tbem. But when I went there just four years afterwards, going over the same ground, I never was so much pleased with anything in my life as I was to see the change, the cheerfulness, the hope on the face and countenauce of every man I met. I do not know if they continue as prosperous as they have for the last year or two whether I will have any more sympathy for them or not; but it is cheering to know, and it is gratifying to say to you at tbis time, that when I read in the paper this morning that this Miners' Association has, in a substantial way, recognized your worthy president, while I wanted his badge worse than anything else in the world, I would have voted to give it to "Old Jake."

Now, my friends, I have talked to you about the gold part of this. I have never said a word to the miners of California that I know of in regard to silver; and if I never have, it is undoubtedly due to my innate modesty as a silver miner. I will say to you that my success in mining was in silver mining, and I have said but little upon the subject for the reason that men all over the country charged that the silver men were the men most deeply interested in the production of silver. I will admit they should he, but I will say to you here now, without going into items, that as sure as you live, the time is not far distant when the people of this country have got to see to it that silver is put on a parity with gold. I sincerely believe, and I have always believed, that it requires simply the substantial endorsement of this great nation to compel other nations to recognize its merits. I do not assume to say how this will be brought about, but I do know that silver is oue of the precious metals. I do know that it has so been considered since the earliest history of mankind, and I do know that it is not the enemy of the human race that some people would have us believe it is.

My friends, I think I have talked enough about mining, but I will not leave without saying a word as to California. I assure you that I can deliver no more patbetic or brilliant eulogy on the State of California than to say to you that I came here because I was obliged to and I never will leave here unless the same condition prevails.

The greatest criticism that I can make upon the people of California is the fact that they do not know California themselves; and the greatest credit I could give to them is the fact that they are positive, every one of them, that they are living in the Garden of Eden, and they are the Adams that make it. Now, do you know that that is one of the most cheerful omens for California. You stop and think of it. You never went into a place in California but what the people who lived there will tell you there is nothing like it on the face of the earth, and they are sincere in it. Now suppose we reverse it; suppose they said "this place amounts to nothing, but the next place does." I tell you it is the loyalty of Californians to their

own locality and to their own State and to the Pacific coast that is bound to make California the chief State of the Union before we are done. I say to you today that I would prefer to be Governor of the State of California than of any other State in the Union. If you would lay down the certificate of election of every State in the Union, I would take California, and I will tell you why. Because the people are made up of independent minds like the miner and the old soldier—if they like you, they like you all over, and if not, it does not take you long to find it out.

Now, my friends, I have talked to you a great deal longer than I intended to but it has given me a great deal of pleasure to meet you; and after I leave here and start home to Sacramento, I will think of twice as many nice things as I have said to you, but I will say that wherever I meet you, under all circumstances, I shall be glad to shake you by the hand and to be considered one of you. I have not intimated what you should do in this convention, and I do not intend to. I know that would not do for me, because it is your duty to tell me what I should do to help you along, and if you will do that, I will obey orders as long as I can. I thank you.

Three cheers were then given for Governor Markham.

After the recess the chair announced the Committee on Credentials.

While the committee was at work the chair introduced Judge Barham, Congressman-elect from the First District. Judge Barham said:

Mr. Chairman and Gentlemen of the Convention:—I had the pleasure and I have the recollection of having seen the pick and shovel in California as early as 1849. (Pointing to the silver badge.) I am not a native son, but I got here as quickly as I could. I have talked all over the First Congressional District, not only once but twice, in the interests of the miners of California, and when I say that, I have to say that what I said in the mountains I would say in the valleys. I have said nothing that did not at all times guard the interests of the farmers. There is no reason on earth why the interests of the miner and farmer should not go hand in hand. When you develop the mining resources of this country, and again permit us to turn out $10,000,000 or $15,000,000 of gold every year, you will then create a home market for the farmer's product, you will bring it immediately home to your people in gold. Now I have no complaint to make at the decision of Judge Temple restraining the miner. It has always been the law that men must so use their own property as not to interrupt any other in the enjoyment of his. While the miner should be relieved from the opposition which surrounds him, the farmer should be protected in his rights. I went through the Sierra Nevada mountains twice during the last four years, seeing many of those people. I saw the miners there, some of whom I saw first when I was a boy; they passed my father's house on Bear river going into those mines. They were then young men, full of vigor and life; now they are old and gray and stooped. Well, they are sitting there between walls of gold, and cannot take it out. As your Governor has said, in my opinion there is no excuse for this Government not relieving the miners. The Government of the United States should come to the relief of the miner. It makes no difference how much money it takes—the appropriation is immaterial. I say to you now, that if I should ever take my seat in the national Congress, it would make little difference to me how much is necessary for the relief of the miner, I shall vote for him.

I have said to the people of the First Congressional District, and of California, that I had a theory upon which, and by which, relief to the miner can and will be secured. I want to state it now, so that if I am in error, I can be corrected by the press and by this convention. I say that the Government of the United States (while the Caminetti bill is a bill in the right direction and I have no criticism to make of it, because it is probably the best bill that could have been gotten at the time), I say the Government of the United States should make a sufficient appropriation to build dams wherever they are necessary, and to build them in such manner that they will stand and protect the farmer below and catch this heavy debris. Then, when this muddy water, which is detrimental to navigation or to the farmers below, flows over the top of the dam, that it should be caught up in flumes and run into the tules along the Sacramento, the American and the Feather rivers, and thus reclaim land that is unreclaimable under any system known to us now—fill them up and make thousands of acres of the best land in the State of California, at the same time driving out malaria along this ague-giving district. Now, I have a particular enmity existing towards fever and ague. I shook with the fever and ague five years on the Bear river, and I would like to vote for a bill to crush it out. Now, the difficulty, it seems to me, to a great extent upon this mining question, is that the people of the East do not understand us; they do not yet understand what California is and what she has got. They do not believe the stories about our climate; they do not believe the stories of our productions; they do not believe that we are separated first from them by a wall of gold, and secondly by a wall of silver. They think we are the biggest fibbers on the face of the earth. As an illustration of that, some time ago I was going from Yellowstone Park to Tacoma, and there were four or five young men from the East on the train. After talking together, and they said they were going to California and to Santa Cruz, and I said, "Boys, go and look at our big trees while you are there." I got on to an unfortunate subject. I said, "There is a church up at Santa Rosa built out of one redwood tree." They looked at me as much as to say that it was a pity that a man whose hair was as gray as mine should indulge in such statements as that. One of them was a photographer, and while we were standing out on the platform, he came up to me, snapped his camera, and said, "There, I have got you." I said, "Got what?" He said, "I have got the boss liar of the world." We want to educate the people of the South, of the East and of the North, that we are not constitutional liars, that we do not misrepresent what we have got, that we have got these millions of gold locked up, and there is no reason why they should not be unlocked, and I say to you that whatever ability I have will go hand in hand with this convention to unlock these untold millions of money.

The chairman proposed three cheers for Judge Barham, which were then given.

MR. FILCHER: Mr. Chairman, I would like to make a motion that when we adjourn for the noon recess we march in a body down Market street to the Palace Hotel, headed by the band. When we met last year we marched from there here in a body, but through some misunderstanding we were not able to do that this time. By marching back we will impress the citizens of San Francisco that we are among them and they will know there is such a thing as a Miners' Convention, and that will lead them to talk about this subject, to enlist them in our cause.

THE CHAIRMAN: It has been moved and seconded that when this convention adjourns for the noon recess that they adjourn until two o'clock this afternoon and that they march in a body to the Palace Hotel. The motion was then carried.

THE CHAIRMAN: Let me admonish you, gentlemen, that every one of you must be in line or he will be reprimanded.

We have a carriage here for the Governor to ride in, and if you will walk behind the carriage he will go.

There were cries of "No carriage."

THE CHAIRMAN: Governor, will you walk with us?

GOVERNOR MARKHAM: I will foot it as long as I live.

THE CHAIRMAN: The Governor says he will stay with us as long as we hang together. Shortly after the members of the convention, led by Governor Markham and President Neff, and headed by the Newcastle band, marched down to the Palace Hotel.

At the afternoon session Judge Belcher addressed the convention as follows:

On the 26th day of Novemher next ensuing, at St. Louis, will he held the Trans-Mississippi Commercial Congress, invited into convention hy the merchants of that city. The object of the congress is to discuss all questions affecting the interests of the people in that territory which may he the subject of legislation hy the United States Congress, and to express to it their resolutions and otherwise the sentiments of the Western people. It will also endeavor to take such steps for the presentation of its resolutions to that body as will commend to its attention and action whatever tends to promote the interests of the Western States and increase reciprocal trade among them, all of which come within the scope of its discussion.

I was asked to present this communication to this body, coming from the Trans-Mississippi Commercial Congress, and to suggest to this convention and to yourselves that within the province of this body, which seems to comprehend business or commercial organizations, that there he appointed from this convention three delegates to this Trans-Mississippi Congress, to meet in St. Louis on the 26th day of November next.

THE CHAIRMAN: This matter will be referred to the Committee on Order of Business.

The report of the Committee on Credentials was then read (see page 330).

The secretary then read the following:

Alameda county 15 delegates, Amador 36, Calaveras 17, Butte 20, Siskiyou 6, Trinity 5, Placer 96, Nevada 135, Shasta 10, Sierra 52, El Dorado 5, Mariposa 1, Kern 1, Mono 1, Yuha 24, Lake 1, Tuolumne 3, San Francisco 44, Santa Clara 4, Plumas 11, Madera 2, Alaska 1, State of Washington 1, Idaho 5, Montana 2, Nevada 5, San Francisco Chamber of Commerce 3, San Francisco Board of Trade 6, San Francisco Stock Exchange 3, San Francisco Technical Society 3, San Francisco Produce Exchange 3; total, 521 delegates.

On motion duly seconded and carried, the report was adopted.

It was resolved to appoint a Committee on Legislation of fifteen members, and one on Resolutions of an equal number.

In response to calls, Mr. Marcus D. Boruck came to the platform and said:

Mr. Chairman:—Probably I may put myself in communication with you hy saying, in my humble way, I have always been the friend of the mining interests of the State of California. My record proves that. While I have not, with the balance of you here, sought as much in the bowels of the earth for the production of the precious metal, not, in other words, being a producer, yet in the forty-five years I have been in the State of California I have been a magnificent consumer of the precious metal. I think it is fitting, as was well said hy Governor Markham, who has proven himself on more than one occasion to he your ardent friend, it is fitting that this convention should he held in San Francisco, as San Francisco to a great extent, more than can possibly he estimated in the few words that I will have the honor of presenting to you, is indebted to the mining element of the State for its great prosperity and for the most of its magnificent buildings which adorn our streets to-day. I said before that I have been a friend of the mining interests, and at the same time I have not considered it necessary to decry that other great interest which has assisted so materially in building up the State of California—I refer to the agricultural interests of the State. But we must recollect that the mining element, if I may so express it, had a preemption right to the State, in that the mining industry brought us all to the State of California. We did not come here to hunt the agricultural products of the State, for when the gold interests were first presented to the people of the world agriculture was not thought of in connection with it. But the foundation laid hy the miners of the State of California has built up that magnificent industry which has not only enriched the State but has enriched other States, and as is partially represented on that picture here to-night (indicating the picture over the stage), agriculture is indebted to the mining element for its great progress and success to-day.

Judge Hilborn, the newly elected Congressman from the Third District, then spoke as follows:

Mr. President and Gentlemen of the Convention:—I have not come here for the purpose of making a speech; I have merely come to listen and to he instructed. I heartily approve of the object of this convention. The country looks to the great West for advice upon this important subject of mining. No more important thing could be brought to the attention of the people at this time. If you can devise some means by which the product of the precious metals, especially gold, shall he so increased that the advancement in the purchasing power of gold can be arrested, you will give to the world the greatest hoon that it has ever received. The great trouble that confronts the world to-day is the fact that gold, the standard of value—the yard stick hy which the values of the world are measured—is being constantly lengthened. Any measures that may he devised hy which the money metals of the world can he increased, and in which the rights of all shall he protected at any time and place, in such measures you may expect my co-operation.

The secretary was then requested to read the communications, and he then read letters received from Congressman W. W. Bowers, Hon. J. E. Rickards (Governor of Montana), Stephen M. White (U. S. Senator from California), and James H. Budd (Governor-elect of California).

Lieut. W. F. C. Hasson read a paper on "The Use of Electricity in Mining," which will be printed next week.

THE CHAIRMAN: Mr. J. M. Wright, attorney, has been invited and has kindly consented to read a paper on "Object Lessons in Drift Mining." I take pleasure in introducing to you Mr. J. M. Wright.

Mr. J. M. Wright said:

Mr. President and Gentlemen of the Convention:—I was not requested to read a paper, hut to present a very few remarks with regard to the present operation of the law in relation to drift mining of the State. If I can hang this diagram, it will make the matter much more plain than anything I can say. (The diagram was held in view before the audience hy the secretary and an assistant.) Now, as you gentlemen cannot see the lettering on this diagram, I will explain that this lower portion, or the hrown, represents the hedrock; the green above is the volcanic capping. These little flags represent the division between the different claims; they may he of 20, 40 or 160 acres, as the case may be.

This yellow portion here represents a gravel hed running in this direction, this being a cross section of the country represented. Here is another gravel hed. Now, you gentlemen who are familiar with drift mining, understand perfectly well that the value of the property lies entirely in this gravel hed. There will he nothing on the hed rock lying hetween those two, everything having been washed down and carried through the gravel hed helow. Now, it has been ruled hy the Department, and it was ruled with reference to the very mine of which this is something of a representation; I can just state the facts as they occurred. Applications for patent were made. The matter passed the Land Office at Sacramento all right; it was then taken to Washington and the Commissioner of the Land Office ruled out one application, hecause he said there had been no discovery of mineral upon that particular claim. An appeal was taken to the Secretary of the Interior, and he ruled out two of the claims for that same reason. So the appeal resulted in the loss of another one of the patents. Now, the problem that is presented, and which should he considered hy the Committee on Legislation, is, How can the interest of the drift miners he best subserved? We have divers and sundry laws as to the quartz mines and as to placer mines, generally speaking, hut as to these drift mines which are located and patented under the patent laws, how can the interest of the drift miners he best subserved? That is the problem before this convention, and it will undoubtedly he presented to the Congress of the United States.

Now, rulings that there must he a mineral discovery upon each and every one of these claims, and that there he a mineral discovery upon this portion, (indicating,) or upon this portion, (indicating,) or upon this portion, (indicating,) as you will all see, the mines will he worked out hefore patents can he granted at all. Where the rock has nothing hut a volcanic capping, it is of no value to anyhody in the world except the drift miner.

Now, it seems to me, and I think it will appeal to all of you, that some law should he devised which will give the drift miner a show. He does not know where his claim hegins; whether the valuable lot will lie under this claim, or this one, or this one, (indicating.) Now, in this case, this work is being done under the supervision of Mr. Chappellet. Here is his gravel hed. When he starts in, he can reach no gravel, he can reach no pay until he reaches this gravel hed. Of course, there is a presumption that there is a gravel hed here, (indicating,) but he must pass through all this vast space of ground hefore he can reach this gravel hed. This depth represents 750 feet, here 800, here 525, here 500 and here 400 feet. (Indicating.) Now it seems to me some statute should he passed that would give the drift miner a chance, not compelling him to show mineral upon each and every one of his locations, but certainly in those cases where the ground is composed of nothing but the volcanic capping, and with the chance to pursue his explorations. But where mineral is discovered in the immediate locality, where one of his mines has been shown to he mineral land, then he should have a chance to hold it, if not by patent, by clear title recognized until he can make his explorations complete, and until he fully explores this ground. The vast amounts of money necessary to be expended in the explorations, you gentlemen all appreciate. You know that not one man in ten of those who are now willing to engage in drifting mine would consider the subject for a moment if they were compelled to make these haphazard explorations, without any hope of holding the ground, after making the exploration. At this time I will not make any motion to the judgment of the convention, but I make this report, with the few remarks I have, which may make clear what I desire to have presented.

Now, gentlemen, there is one other matter which I have not been invited to speak upon, but which I desire on my own account to present to your minds, it being a subject with which I am more or less familiar. You gentlemen have had presented to your minds by various speakers, and by the various articles you have read in your mining journals, the fact that everywhere throughout the mining countries, the Courts have decided against the mining men and in favor of the agriculturists. Let us take for instance, the great question of water. It is perfectly fresh in the minds of every one of you how the great fight hetween appropriation and riparian rights in this State went on a few years ago, and the old common law determined in favor of riparian rights as against the law of appropriation. Now, far he it from me, as an exponent of the law, in my humble manner, to say one word against that great monument to the intellectual power of the English speaking race, the common law, but it seems to me, in this one particular, and its applications to the mines of the country, the common law does not go far enough, it is not flexible enough. It seems to me that in this country where water is absolutely necessary to the development of your mines, and where it is necessary to the irrigation of your lands, that the law of prior appropriation should prevail, against the law of riparian rights. I only speak of this by way of illustration.

When you come to the question of quartz mines, which I am now approaching, the common law, as you are well aware, gives every man everything that lies upon the top of the soil he owns to the heavens and to the center of the earth beneath. The lines are drawn down vertically to the center of the earth—everything within those lines drawn down vertically belongs to him. Gentlemen, you may not he aware of it, but in your mining industries and mining courts, the intendment of the law is held to he in favor of that as against your ownership of the extra-lateral portions of the lode you locate. There should he provisions in your statutes to the effect that all intendment should be in favor of your ownership and holding of your extra-lateral rights. For instance, only a few months ago—I think it was in the month of April or May, 1894, after the mineral courts had settled the question regarding the ownership of extra-lateral portions of mining lodes, so that nearly all of the mining lawyers throughout the United States were satisfied with the then condition of affairs—the now celebrated Amy case was decided by the Supreme Court of the United States, and there it was stated that wherever the line crossed the course of the strike of the lode, that made an end line. The question was then raised, How is it where one end line crosses a lode, and one side line crosses a lode? The har of the United States had been divided upon that question. If each one of those lines crossing a lode is an end line, then a miner might have 1499 feet of a lode within surface lines, and if it passed out one foot hefore it reached the end of the line, he would have no extra-lateral lodes, and no matter what expenditure he put upon his lodes, he would he at an end the minute he reached his surface lines. I think this question should he settled for all time, and that these questions should he settled by legislation; first, as I said a while ago, an intendment should he in favor of holding and ownership of extra-lateral lodes heyond your surface boundaries, and the mineral of said holding should he protected hy statute, so that from this time forth, after twenty-two years of litigation, since May, 1872, when a man locates his lode he knows what he has got. It is the certainty of yo rownership that makes it valuable to you. You are not willing to put $10,000, $20,000, $30,000, $40,000 or more thousands into the ground, so long as you fear that next week or next month, or any time afterwards, it may he taken from you by those who claim your lode on its downward course. What you need is a clear and explicit definition in the statute itself, and if I may suggest to the gentlemen who may compose the Committee on Legislation, in my humble opinion, the law as it stood—I am looking straight at you, Mr. Ford—the law as it stood after the decision of the Amy case hy the Supreme Court, is the one that is fair and just to the miner—to all of them. I helieve the determination of the Amy case, as expounded hy the Supreme Court of the United States, is what the miners want, and I helieve every mining lawyer within the sound of my voice, and that every miner who understands it, does likewise.

THE CHAIRMAN: Gentlemen of the convention, Senator Ford has been invited to address the convention upon the question of hydraulic mining and legislation in regard thereto.

Senator Ford spoke as follows:

Mr. Chairman and Gentlemen of the Convention:—The committee having in charge the arrangements asked me if I would prepare a paper upon mining legislation, State and National. I told them I would do so if I could find the time. Unfortunately for me, probably fortunately for this audience, I have failed to find any time at all. My own poor affairs somehow happen to take up my time, and I have no paper to read to you. But, being somewhat familiar with legislation on mining affairs, I will just briefly, probably somewhat disconnectedly, say something about mining legislation. You all probably understand that there has been less legislation upon the mining question than probably any other question that concerns the welfare of California.

The State of California, through her Legislature, prior to the organization of this association, had contented herself with simply adopting the rule that the local customs and regulations of the diggings should control in all actions relating to mining claims, and Congress, prior to 1866, has enacted no law, and has up to this time enacted no law—or at least prior to the organization of this association—except a law, the one of 1866, which was enlarged upon in the Act of 1872, which acts did but little more than to legalize what had therefore been a trespass and render lawful the regulations and customs of the miners and provide a means whereby the miner could obtain title to his property. It is a matter of history that these customs, rules and regulations of the old pioneer miners have stood the test of time and have proven themselves to have been the most just and the most sacredly revered of any laws that we have to-day in California. That spirit of fairness guided those noble men who came here in those times—those men who went up into the Sierra Nevada mountains and through the hills and mountains of this State and smote those one time silent hills like Moses of old, and caused streams of gold to gush forth into the channels of commerce, which quickened into life this commonwealth.

Those customs and regulations were born of a peculiar and anomalous condition of affairs. They were born of a necessity to provide laws to meet new conditions surrounding the miners. Those are the laws and customs which have, so far as legislation is concerned, governed the mining industry of this State. The great hulk of the law concerning mining has been built up by the rulings of the court and decisions of the Land Department. Through the decisions of the courts, which were founded upon these old-time regulations and customs, a code of laws came into effect, which began to be demonstrated throughout the State. The time arrived, however, when the surface placers were worked out and deep channel mining hegan to he conducted. Then, some years ago, we came in contact with the valley people, who desired to preserve the navigable streams and lands adjacent to them. You are all familiar with the struggle which finally ended in the famous Sawyer decision, and the monitor was for a time hushed. Then came discussion among our people and a desire to avoid the damage that we had unfortunately inflicted upon the navigable stream, and it became apparent to the people of this State that the gold in these hills was an absolute necessity to commerce. The Legislature had been against us, the sentiment of the State had been against us; the idea prevailed that the mining people had no regard for the law and that they were regardless of any damage they might do so long as they were permitted to conduct their own business. This position, regretful as it was, became a State opinion, so to speak.

Finally, however, it began to dawn upon our people that we miners were a pretty good sort of people after all; that they did not all wear pistols in their helts and knives in their hoots. There finally came a time when the Governor of this State, in his inaugural message,

said to the people of the Legislature and the people of the State: "Something must be done to help our mining friends." Governor Markham, be it said to his credit, has the courage to say to his people that hydraulic mining could be resumed without any damage to other interests, if the proper engineering skill were brought into requisition. He said to the Legislature and again to President Harrison when he met him at the State line: "Sir, if these gold fields were in Russia or Germany or France, those nations would see that the gold came out of the hills to flood the channels of commerce and help along the industries of the country." That was the beginning—that was the touching of the button. Governor Markham touched the button, and we must do the rest.

From that time the sentiment has been changed so that our appeals to Congress have been listened to with more respect. Our appeals to the Legislature have been met with most warm welcome. The Senators and Assemblymen of the Legislature did nobly for us miners; but first let me suggest briefly the plan of campaign that was outlined in so far as hydraulic mining was concerned. That is only one branch of the work of this association. It was determined that there was a solution to that question and that solution was this: In the impoverished condition of the miners, and in view of the fact that vast neighborhoods have been depopulated, the monitor silenced, millions of dollars worth of property destroyed, schoolhouses and churches swept down stream, we realize that some help must come from State or nation, and the theory was that, as the Sacramento river was a navigable stream, and needed protection, and that there were millions of pounds of debris in the tributary streams already brought there from causes not wholly mining, that California must undertake the work of protecting its navigable streams. The engineers agreed that one remedy was to impound in the mountains at proper places, under the supervision of the engineers, by means of restraining basins and dams, the debris that came down and would otherwise reach the navigable streams. While doing this, it would be an easy matter to also take care of such further tailings as might be sent down by the miner. It was a plain, simple feasible proposition. The engineers told us it could be done. It has been done in France at the foot of the Alps; the dykes of Holland is another illustration. There was a feasible solution of the question.

In order to carry that plan into effect, it was necessary to reach Congress. The last State Legislature, acting upon this plan, passed two bills—one defining hydraulic mining, and the terms by which it would be carried on, namely, that it could be carried on whenever and wherever it could be carried on without material injury to other interests. Then the next proposition was to make it possible for the miner to comply with the proposition. The way to do that was to furnish the necessary funds to build the works. The last Legislature then, following up the first measure, passed a second one appropriating $250,000 for the erection of such works as should be used in restraining the debris from the mines and whatever debris is there now, upon condition that the General Government provide at least as much for the same purpose. This would make us a fund of $500,000, which would go a long way toward settling that proposition.

Only a few days ago I was talking with an eminent engineer, and he told me that for less than $500,000 he could construct a dam on the narrows of the Yuba river, 250 feet high, if need be, that would hold back all the debris the miners could send down from the Yuba watershed.

This much has been done: California has sent her messenger back to Washington and said to the General Government: "While we cannot undertake this work alone, California cannot ask you to do it alone, and we will help, but your help we want. It is true, Congress has lent us a favorable ear, and recognized our claims, but has not as yet seen the way clear to do just as we want. We have, however, much hope for the future. We have hope that the agitation which has gone on and has gradually educated our people to this fact, which has really stood in our way to a great extent—our valley neighbors heretofore have failed to realize that we have no desire on earth to injure them—that if we can take them by the hand and map out some plan that will protect their navigable streams and adjacent lands, and at the same time let our mines go on, that is what we want to see. The miners are perfectly willing this matter should be left to the skill of American engineers. We know it can be done—we know it is being done to-day in the mountains under the Congressional Act under which the Commission has been appointed, but it is being done in isolated cases, and no general revival of hydraulic mining can take effect until this assistance from Congress can be had. When that is done, aided by a stream of gold from our own State treasury, you will hear once more the songs of prosperity ring from the mountains and streams of gold rush forth into commerce to quicken the life of California, and guard and protect us against the hard times that come to us from Eastern States."

There is one other piece of legislation that is highly desirable. Mr. Wright has very clearly and forcibly explained to you the necessity of Congressional action that will enable our drift miners to feel more secure in their titles to their claims prior to obtaining title. This is a matter that has engaged the attention of the Association. A bill was drafted, covering the points suggested by Mr. Wright, and sent to Congressman Newlands, he being the only member from this coast on the Committee on Mines and Mining.

At the same time a bill was introduced by Senator Stewart in the Senate and by Mr. Camiuetti in the House. I will not trespass upon your time by telling what has been done with all these measures, for the Committee on Legislation will probably report concerning them. These matters are well in hand, and we hope at the short session of Congress this winter to so amend the Stewart bill, which has already passed the Senate and gone into the House, as to incorporate in it the ideas suggested by Mr. Wright and others.

In conversation with Mr. Newlands, he told me that it was absolutely necessary, or at least highly important, that we should have some one there at Washington this winter, if we expect to accomplish anything in the line of legislation during the short session. I agree with Mr. Newlands in that matter, that if we can find some one who will take the time to go to Washington, who understands this matter, and will present it there, answer all questions that will be asked, it will aid us materially in this matter.

There is another phase of this matter which does not concern legislation, and that is the great good this Association has been to the mining industry through this State, by way of advertising it. About two years ago, before the celebrated inaugural address of Governor Markham, which started all this thing going, and opened public sentiment—and we ought to be extremely grateful to him for it—prior to that time, throughout this country and throughout our own State, it was generally supposed that the mining industry had about died out, that there was really little left of it, that the gold fields were about exhausted. Now the whole country is alive to the fact that there are vast gold fields in California. More developments are going on in the Sierra Nevada mountains than for ten years past, and I say this Association, with the impetus given to it by the Governor's inaugural address and the energetic work done by the officers of this Association, has brought about this condition of affairs, and it rests with us to keep the good work up. Keep pegging away at national legislation, knocking at the doors of Sacramento, keep up the agitation, agitating among ourselves. The way to get a thing is to keep at it until you get it. If we keep on agitating this question, send a representative to Washington, urge upon our Congressmen the necessity of doing something for us, we will accomplish all we deserve to accomplish, and will deserve the thanks, not only of California, but of the entire nation.

MR. THOMAS (of Alameda): Mr. Chairman, I move a vote of thanks to Judge Hilborn, Mr. Wright and Senator Ford. This motion was duly seconded and carried.

MR. WRIGHT: Mr. Chairman, while Mr. Ford was on the floor I was desirous of asking him a question. I think this convention knows a good thing when it has it, and I think Mr. Ford can give us some further information. I would like to ask Mr. Ford what is to prevent the carrying out of the debris down upon the swamps of Yolo county, as suggested by Mr. Barham this morning. I spent ten years in New Mexico and came back to California after this war was over between the miners and the farmers, and I heard of those banks of debris and made a trip up in the mountains. I found there were vast expanses of swamps that needed this debris. I would like to know why it is not carried onto them.

SENATOR FORD: In reply to that I would simply say that the miners are not particular about the details of this matter. The Federal engineers say they can do it. They say to us, "You get the money and we will see that the works are constructed." I am not an engineer and do not understand this question very well, but the engineers say they can accomplish it. If it can be done by running the debris on the tules, or by running the tailings into the American basin very well. I should have referred to that in my talk. The detail must be left to the engineers.

THE CHAIRMAN: I will state for the information of the convention that Mr. Rose, Commissioner of Public Works, has been invited to address this convention. He has a plan that he submitted to the Executive Committee some time since, and he will undoubtedly address you upon that subject. There has been another gentleman invited to present his views to this convention on the question of "The Department Rules for the Miner"—Mr. A. H. Ricketts.

The paper by Mr. Ricketts is given elsewhere in the PRESS.

THE CHAIRMAN: The chair will announce the Committee on Order of Business, so that they may have their report ready to-morrow morning as the first order of business.

The secretary then read the following as the Committee on Order of Business: Julian Sonntag, chairman; H. T. Power of Placer, A. Tregidgo of Nevada, Grant I. Taggart of Alameda, R. H. Campbell of Siskiyou.

On motion, duly seconded and carried, a vote of thanks was extended to Mr. Ricketts for his able paper.

On Tuesday morning, after the Committee on Order of Business had reported, the chair announced the following committees:

Committee on Legislation.—Tirey L. Ford, E. A. Belcher, J. M. Wright, Chas. G. Yale, A. H. Ricketts, R. McMurray, J. B. Treadwell, Thos. G. Merrill (Montana), E. W. F. Deal (Nevada), W. W. Kellogg, H. N. Riordan, Ira Hill Reed, C. C. Bush, J. F. Townley.

Committee on Resolutions.—E. E. Voorhies, C. W. Cross, S. B. Christy, J. J. Ives, W. R. Thomas, A. Ekman, T. T. Lane, T. H. Leggett, Fred Searles, John Spaulding, James Bryan, J. E. Lyons, T. C. Loftus, J. M. Walling, W. E. Sharon.

The committees withdrew to attend to their duties, and Senator Geo. C. Perkins was introduced, and said:

Mr. President and Gentlemen of the Miners' Association of California:—I congratulate you, gentlemen, upon having met, as you have in this convention, for the purpose of reconciling differences, if any now exist, between the agricultural and mining interests of our State—for certainly they should go hand in hand together in developing our great resources. There can be no antagonism between these great interests any more than there can be in the mercantile and manufacturing interests. But the way to reconcile these differences is to do just what you are doing to-day in this convention, by discussing the various propositions. Why, our Government is one of discussion, and there is scarcely a law to-day upon our statute books but what has been the outcome of argument and discussion, and so it is with this mining, this debris question.

We would have had no California, no golden city of the West, had it not been for the mines of California, and for the enterprise and the energy and the explorations of the miners that have developed the great mineral resources and given to the nation, to the world, $1,400,000,000 in gold alone. And to-day, when every other interest in our State seems to be prostrated, no profits in commercial business, in manufacturing or farming, yet the miners of California are bringing forth from the hidden treasures of the earth over a million dollars a month in pure gold and putting it in circulation, giving employment to tens of thousands of miners and to thousands of machinists.

But not only the golden interests—we have great coal interests, we have chrome ore, we have lead ore, we have silver ores in California, and, what is more, within the past year you are developing a great oil interest. One mining company alone in this State is producing 20,000 barrels of oil every month, and it is capable of increasing this, I believe, until the output can be 50,000 or 60,000 barrels of petroleum monthly. While we are digging gold, petroleum is the twin sister to gold, for in it we have the fuel that evaporates the water and makes the steam and runs the engine that pumps the water out of the earth, and so giving employment; and so together we should go on developing these great interests. In every county of this State there are minerals beyond enumeration that only want to be brought to the surface, smelted, remelted into different form to make serve it in the great mechanical and commercial world.

While the convention is in session I hope you will give expression on the silver question. While California, perhaps, does only produce about $5000 in silver—during the past year—yet we have mines in San Bernardino, Inyo, Mono and other counties in this State that rival in richness those of Arizona and Colorado, and I believe this convention should declare for an American policy on the silver question. While many of us may believe it impolitic to open our mints to the unlimited free coinage of silver from other parts of the world, from Mexico, from South America and Central America, there can be no question, in my mind, as to an American policy that opens the mints of the United States to the products of the silver mines of America.

Your president and myself remember the time when we first owned the rocker; we thought that was mining on a large scale; when we came to the Long Tom and commenced shoveling dirt, that was making splendid progress, and when he came one day with a pair of gum boots without soles he said. "I have a new plan for saving the gold: I will have sluice boxes," and he was shoveling it up with one of Angel's old shovels that did not build the Union Pacific. Later on we got the cost reduced to seventy-five cents and we thought we could progress no further.

Later on, he found a hydraulic, and he says, "Perkins, I am hydraulicking this down for one and a half cents per ton. That beats the world." The judgment day was near at hand. And so he succeeded in taking out his wealth. Like most of old Californians, he is distributing it among the people—they never keep it, you know. And so this State of California owes her greatness to-day, in great measure, to the pioneers of California, for I venture to say that statistics would show that prior to 1885, ninety-nine out of every one hundred people who came here were attracted by the gold mines of California. While we have developed all these great agricultural and manufacturing resources of our State, our mines have just commenced to produce, and I believe, going on as you are progressing, in the past few years by these appliances, that the product of California, instead of being $12,000,000 or $13,000,000, will in three years be $25,000,000 per annum. It depends upon you, gentlemen, by your wise, your judicious deliberation—it depends a great deal upon you, what you will do to stimulate this great industry, with malice toward none, with kindness to all, believing that the agricultural interests are the miners' interest, I feel confident that you will recommend such legislation that cannot fail to be protective to the best interests of this State.

Three cheers were then given for Senator Perkins.

Thos. J. Clunie, on being introduced, said:

Mr. President and Gentlemen of the Miners' Association of California:—I can assure you that I esteem it a great honor to be called upon to address such a distinguished assemblage of gentlemen as I see before me to-day. I see before me my friends who have helped to carve the destinies of this great State, and, as was well said by Senator Geo. C. Perkins, they were attracted here by the gold developments of California. It seems to me, my friends, judging from the conditions that exist to-day, we are returning to first principles. We are getting back to hauling fruit from Fresno in the old primitive way, and we are returning to the collection of gold that made this State famous the world over.

Some years ago I had the honor of representing this State, in part, in the United States Senate. A bill was introduced there for the purpose of building dams to restrain the debris in the mountains. I examined the bill, and I believed it to be crude, and I did not think it would further the interests of hydraulic mining. I opposed it, but when it came to the General Government taking hold of this subject, I stood in to the full extent of my ability. I realize, my friends, more than ever to-day that if this State where I was reared—a State that we all love—should continue to prosper, we have got to return to the mining industry as the chief of all.

Mr. President, that is a pretty picture there before you. But I know that there is a gray cloud that you see in that part of the picture have ceased to pay the farmers of this State. You and I know that it is impossible for them to raise grain at the present prices and make a living; that they are going in debt day after day; that enterprise and energy of the entire State is prostrated. But the old pioneers of 1849 and their children to whom they have transmitted their energy and indefatigable will are again coming to the front. You say the people are with you. Of course they are with you; why should they not be with you? They realize that they cannot get along without you. I was reared in the Sacramento valley, the place where the injury was done through hydraulic mining, and I think if they had to do it over again, it would be better to sustain the injury and let hydraulic mining go on. But we have found a way, my friends, in which no industry can suffer. We have found a way, reported upon by the men who excel in engineering. They tell us that the debris can be impounded and the gold that lies hidden in your mountains can be thrown into the lap of the nation. Why should not this receive encouragement? You and I know that in the dark days of this country, when we did not know whether our Government was to be maintained or not, it was the gold dug from the mines by the California miners that maintained the credit of this nation. It is the gold that you can dig now that will maintain its credit. Fourteen hundred millions of dollars, Mr. President, have already been taken from our mountains in California.

More than that lies hidden there now, waiting to give you an opportunity to take it out. Suppose you had fourteen hundred millions added to the monetary system of this nation; would there be any need then for an issue of gold-bearing bonds? Would you not be able to take care of the silver of the country? Would you not have gold enough to maintain the parity between gold and silver if they would let you take it out of the mountains? I say to you, my friends, referring to the suggestion of your president in regard to appropriations that we have not been fairly dealt with, this great State has put into the coffers of the nation for many years no less than $16,000,000 annually, and in return for that, my friends, you have received a hare, beggarly pittance in the way of an appropriation.

I ascertained that in the war times, when the lamented Lincoln presided over the destinies of this great nation, that he called upon California—he called upon her people and its Governor. They responded to the tune of millions of dollars, taken from our State treasury, and given to the nation to be returned at the close of war. I found out that upwards of $3,000,000 had been advanced by this State for that purpose, and that not one dollar had been returned to the public treasury. I gave a year's time to that, my friends; we went all over the vouchers, and every public official that examined them, agreed that they owed this State upwards of $3,000,000 not counting the interest. I prepared the bill. It was submitted to the committee. They could not get around our evidences, and they unanimously reported it. It was on the calendar. I had the word of Speaker Reed, that I should be recognized to take it up, (and he never told me a story in his life—I have a great deal of respect for him), and he called me up and said, "Clunie, I cannot let you take that bill up. We have figured up our appropriations, and they are already immense. That has got to go over to another Congress."

My idea was to make a practical suggestion to you people, not that I can tell you how to mine, for I am not a practical miner, but I know something about the making of laws. I understand that what you want is the ways and means to get the work started and to go on with it. My idea was to get the Legislature of this State to pass a joint resolution, saying to Congress that any money that is appropriated for the Sacramento, the Yuba and San Joaquin rivers, and for the purpose of building dams, that that may be credited on the amount of money they owe us.

In other words, they concede they have borrowed upwards of $3,000,000 and for thirty years have refused to pay it. If the people say to them, "You give us that money in order that we may pour into the lap of the nation millions of dollars to add to the wealth of the country and credit it upon the amount that you owe us, can there be any objection to that? This State has appropriated $250,000. It is lying there waiting for the General Government to appropriate a like amount. But they say, "We cannot appropriate money to build dams; we cannot help the miners in California. They must paddle their own canoe as the people of Maine and Georgia do." Of course we are all united on that subject. They say: "We cannot take money out of the treasury for that purpose." But if you say to them, "You are doing the nation a favor, and it is not costing you one dollar to do it," I believe you could get the appropriation. I believe that if you back Mr. Caminetti up he will get the $250,000, and it will be credited on the debt that the Government owes you.

Now then, so far as the appropriation for these rivers are concerned, when you get four or five enterprises going on in the State, the harbor at Eureka and the harbor at Oakland, and when they go down to Santa Monica and try to find another harbor there, and you get a law made for this particular purpose, it is charged to this State, and you cannot get appropriations for the rivers, and I would fight any new proposition that did not let you fix these rivers and impound your debris in order that this mining may go on.

The only way, in my judgment, is to have the Legislature of this State pass a joint resolution saying, "We want the money you owe us, and we authorize the Government to credit this on the amount of money that it owes." This is practical; it is common sense: it is decency; it is justice; it is right, and it can be maintained anywhere.

Now, gentlemen, I want to say to you that I am heart and soul with you in your enterprise, not particularly because I love you any better than I do anybody else, but I love this State and I believe that its material prosperity depends on the success of this organization.

Three cheers were given for Thomas J. Clunie.

Hon. T. G. Phelps was presented to the convention, and said:

Mr. Chairman and Gentlemen of the Convention:—I feel a great deal of embarrassment in appearing before you at all—you gentlemen who have given so much more thought to the questions affecting the mining interests of California than I have had occasion to do. But I think I can say this, that the almost unanimous interest of the State of California to-day is in favor of the mining industry. And that any legislation which you may desire, either from Congress or from the Legislature of this State, not prejudicial to other interests, will be accorded to you. I believe that every safety shall be given to the miner in his hazardous undertaking. I believe that if he is not now in law protected, he should be protected in following his lode to the center of the earth, whether it takes a vertical line or whether it goes off at an angle. Furthermore, he should be protected in his holdings; no land should be transferred by the Federal Government to any person or corporation which, though it may not show gold on the surface, is known or believed to contain gold in the depths. The miner should be entitled to prospect the whole country and avail himself of his discoveries wherever they may be.

I agree with the able gentlemen who have preceded me, that our languishing industries demand the development of the mining interests of this State. We want to see the Sierra Nevadas again repeopled. We want to see 50,000 miners at work, which means a population of 250,000. Now, this 250,000 people are worth more to the agricultural, mercantile and manufacturing industries of this State as a market for our products than is the commerce of any single country under the light of the sun. It is that market we want. Aye, we want more; we want the gold that you will produce to relieve the avenues of commerce; we want it not only to stop the further issue of bonds, but we want it to pay our obligations, and when they are paid, we will see to it that we keep some of it at home.

Governor Perkins and Senator White, during the last session of Congress, sought to, and did, so far as the Senate was concerned, secure an appropriation for the building of debris dams, but it was stricken out in the House. This is an appropriation which the Federal Government owes us. It is in the interest of the Federal Government to make it. But, if she will not do it, we will do it ourselves.

MR. TREOIDGO (of Nevada county): Mr. Chairman, before adjourning, I would like to offer a resolution. There have been some very important papers read before this convention, and as the delegates here present only represent one in ten of this great Association, I move that the transactions of this convention be printed in pamphlet form, and that a number of the pamphlets be sent to the secretary of

(*Continued on page 333.*)

Mineral or Agricultural Character of Land.

The following argument is respectfully submitted by the California Miners' Association to the Congressional Committee on Mines and Mining in support of a section of the Newlands bill relating to contests between mineral and agricultural claimants of land.

TIREY L. FORD,
E. A. BELCHER,
CHAS. G. YALE,
Committee on Legislation, California Miners' Association.

The proposed ammendment to section 2335 of the Revised Statutes of the United States relating to mineral lands, contains a clause which reads as follows:

"That in investigating the character of the land with a view to ascertaining whether it is more valuable for mineral than for agricultural purposes, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be presumptive evidence that the land in question is and always has been mineral in character."

It is to be noted that the paragraph in question does not designate such land as mineral as may have adjacent to it discovered or developed mineral, but merely that evidence may be taken that there is such mineral adjacent. If this be proven it is then to be taken as *presumptive* evidence that the land in question is mineral in character. There is nothing unfair in this to the agricultural claimant, since common sense would show that with discovered mineral adjacent such land would naturally be more of a mineral than an agricultural character. The miner must prove that there is discovered mineral adjacent to his claim. It is clearly the intention of the Government to reserve mineral lands for miners, but without some such provision agricultural claimants may, and do, take up homesteads right between two developed mining claims, and the contesting miners have no chance to prove the probable existence of mineral on the tract in question, though the existence of the other claims is clear evidence of the miner's presumption.

As it is, under present conditions and rulings, large tracts of mineral land are passing annually from the domain of the miner and prospector into private hands for which the Government never intended them. Each year sees more restricted those areas within which the prospector may search for mineral; and he sees taken from him, for half the price he is willing to pay, ground originally set aside for him by the nation. Countries of older civilization than ours, better realizing the value of the mineral resources, throw every possible safeguard around the mining territory and in every way assist the miner and prospector to discover and develop it. Here, he must not only contend with the manifold obstacles connected with the work of prospecting and developing claims, but has a more difficult task still in fighting for his rights in opposing "regulations of the Land Office" and "decisions of the Secretary of the Interior," written mainly by clerks who know nothing about mines and mineral lands, and promulgated and enforced by ephemeral officials with no direct interest in or practical knowledge of the subject.

While the prospector or miner sees that the Government places double the valuation upon the mineral that it does its agricultural land, and that it quadruples the expenses and difficulties of acquiring title to the former, he finds it difficult to comprehend why all the rulings and decisions of the departments of the same Government favor the agriculturists as against the miner and permit them to readily acquire lands manifestly intended for him. He does not go into agricultural regions to prospect, for reasons which are plain to him and should be to every one; but he finds agricultural claimants coming into what is clearly and manifestly a mineral belt and easily becoming possessors of mineral-bearing ground for which he is himself unable to obtain title, unless by long and expensive contest. He is met by so many palpably absurd and unjust rulings and decisions, which apparently evade the mining laws, that he at last realizes that these laws are themselves defective or incomplete when they permit this. It becomes evident to him that the Government does not as yet realize the injustice it is doing, not only to his class but to itself, in allowing the mineral lands of the country to pass into the hands of those who cannot utilize them, but hold them at greatly advanced prices to sell to those for whom they were originally intended.

The fact that the ground in dispute is on a well-recognized mineral belt, with more or less developed mining claims adjacent, is not considered under present conditions; but if the proposed amendment becomes the law, evidence that there are other mines in the neighborhood would have to be admitted and the Government would get $2.50 or $5 per acre for land it is now generally selling for $1.25 per acre, and the miner would have his rights protected.

The miner cannot well spend money developing ground for which he has no title; and he cannot get title until he does develop it, since he cannot comply with the present laws and prove it valuable without such work. That this system is a manifest absurdity is apparent. Agriculturists are not required to prove that the land is fit to raise a crop of any kind, and that, if it can, said crop will be valuable. But the miner must prove, before he can do any work on his claim to get title, not only that there is mineral, but that the mine is valuable. There are numerous instances in all mining regions where many thousands of dollars have been spent on a claim before it is found to have no value, or to be valuable. This is one of the practical features of mining which the law fails to recognize. Under the existing practice in investigating the character of land before the U. S. Land Offices the miner is required to prove that each twenty acres of a placer claim contains mineral in sufficient quantity and of such a quality that it can be profitably worked. This is often impossible for the prospecting miner, who is the original claimant, to do.

He is usually in poor circumstances, living on such inexpensive food as he can carry with him in the mountains, the hope of realizing his dreams and finding a rich mine being all that spurs him on.

The prospector is usually an energetic, intelligent and experienced miner who is so far above his class that he only works long enough for the owners of developed mines to enable him to accumulate sufficient money to pay for the plainest kind of necessities for his intended expeditions. The probable boundaries of the mineral regions are easily discernible to his practiced eye. He does not go down into the valley lands, nor does he prospect the foothills where it would be impossible to search. He confines his operations within the recognized mineral belt until he comes to some developed mining claim. It is in country adjacent to such claims where he is most likely to find mineral ground. He makes inquiries for the boundaries of any such claim, which must be marked on the ground "so that they can be readily traced," finds them, and then searches for a piece of "vacant land," that is, a piece not already "claimed" by some other person, on which to make and mark his "location."

He is guided in this to some extent by what he has observed in the mine in operation and commences his prospect shaft where his experience and intimate knowledge of information, etc., tell him he will be apt to find the continuation of the vein or lead of mineral or the gravel channel which is being developed on the adjacent land. This is no guesswork with him. If he is sufficiently skilled and finds some place in the vicinity where the indications are favorable, he begins work.

If in his judgment he has found a payable lead and made what is called a "discovery," he proceeds to make a location in accordance with law, with which every prospector is more or less familiar.

On unsurveyed land he can work off the boundaries of a placer claim in any direction, no matter how irregular, because the miners who drafted the original laws know that those placer deposits were so irregular that they could not in justice be limited, except by area, and the walls or sides being vertical made it fair for all.

The clerks of the Land Office, for no other apparent reason than to make it easier to draw them on the public land maps, have tried to confine "placer locations" to rectangular subdivisions when on "surveyed public land," an injustice which some considerate person has qualified by inserting "as near as practicable," in the statute.

Whether it be a "placer" or a "lode" claim he marks it out on the surface, writes out a "notice" describing the location, and putting one "notice" on the "location" he takes a duplicate to the proper "Recorder" and records his claim in accordance with law.

Now his real trouble begins. The fact of his "recording" his location has been noised about and drawn the attention of curious or interested parties in the vicinity to his "find," who thereafter keep a close watch on his proceedings, and if his "prospects" improve, they, with the instinct of greed common to men, set about to reap a benefit to themselves by taking advantage of his industry.

There are several ways of accomplishing this, but the one most in vogue is the "agricultural claimant" game, to protect him from which is the object of the clause of the proposed amendment to Section 2335.

This is an ideal case, but as will be shown further on, by extracts from the local U. S. Land Office, it is a "game" which is being systematically played to the very serious detriment of the development of our mineral resources.

The population in the mineral belt and in the close vicinity of the developed mines has been attracted there by the demand for labor created by the operations at the mines and the opportunity offered for supplying the necessities of the laborers and their families.

It is in no sense an agricultural population. Cereals cannot be successfully cultivated, on account of the altitude and the extreme roughness of the face of the country.

Patches of alluvial soil a few acres in area are found in the beds of the ravines, on which can be raised a little hay and some vegetables and fruits, sufficient perhaps for the local demand, of such varieties as the altitude will permit.

These people, honest and respectable in all other respects perhaps, have become so accustomed to this "agricultural claimant game" from the ease with which it is played and the immunity from punishment in similar cases with which they are familiar, do not hesitate, when one of their number makes a "homestead location" on such legal subdivisions of the public land as will cover our prospector's mineral location, to accompany him, the homesteader, to the proper Land Office as witnesses and swear that they believe that the land applied for as a homestead is "more valuable for agricultural than for mineral purposes." Being entirely ignorant of mines or mining, it is quite easy to swear to a negative proposition.

The expenses of these witnesses amount to a considerable sum, but as they are all residents of the same community and will require similar services for themselves sometime, they are cheerfully met.

News of this homestead filing reaches our prospector, and if he has any money left he travels to the Land Office, fees an attorney and files his protest in due form.

A "hearing to establish the character of lands" is ordered and the miner is obliged to show, not that —— land in the neigbborhood is mineral (and theoretically the land in dispute must contain mineral), but that the particular piece in question actually does produce mineral. Proof that the land is of little agricultural worth is not satisfactory to the Department; and, further, it has been required by the Land Offices that the claimant must prove the mine to be a valuable one. That it is impossible for the miner to prove this without great expense in sinking shafts and running tunnels, is self-evident.

Therefore, the bearing results, from the preponderance of evidence on the "homesteader's" side, in a tract of 160 acres of land, well known from its surroundings to be valuable mineral land, being awarded to the homestead claimant when it is equally well known that he does not intend to cultivate it and would never have dreamed of possessing it if he did not intend to sell it again at an increased value as a mine, or perhaps to hire this unfortunate prospector to work it for him at current wages.

The injustice of this is apparent, and to prevent it and give something like fair play to the mining interests is the object of the proposed amendment.

A law that evidence that mineral has been discovered or developed in adjacent ground shall be prima facie evidence that the land in question is mineral and always has been, will effectually prevent these barefaced robberies and encourage prospecting.

That the foregoing is not an exaggeration is proved by the following extracts from the records of the Sacramento, Cal., Land Office.

In a township which was returned by the surveyor-general as mineral land, these homestead entries were made. As will be noticed, each swears for his neighbor:

1. H. Beauchemin. Entry No. 3718.
Witnesses: C. C. Reed, Geo. Davies, J. Zavella and J. Hillary.

2. C. C. Reed. Entry No. 4332.
Witnesses: H. Beauchemin, Geo. Davies, J. Zavella and J. Hillary.

3. Geo. Davies. Entry No. 4075.
Witnesses: H. Beauchemin, C. C. Reed, J. Zavella and J. Hillary.

4. J. Zavella. Entry No. 4205.
Witnesses: H. Beauchemin, C. C. Reed, Geo. Davies and J. Hillary.

5. J. Hillary. Entry No. 3758.
Witnesses: H. Beauchemin, C. C. Reed, Geo. Davies and J. Zavella.

Final proof of all was made at the same date.

All of this land is notoriously mineral land and contains within its boundaries several of the best lode mines in the district.

On H. Beauchemin's entry is the Lockwood mine, a most valuable mine, which for years has been the principal support of the community around the town of West Point.

Most of the entries have been contested, but with what result has not been ascertained. That it entailed great expense unnecessarily upon the mineral claimants, is undoubted.

These "homestead entries" were unnecessary, because the miner, as a rule, cares nothing for the surface of his claim.

He would be glad to lease or almost give away all except sufficient for his buildings and a few shafts and dumps for his waste rock.

He would be glad to have any part that could be cultivated put to such use.

In this one notoriously mineral township, containing about 22,000 acres, twenty-three of these peculiar homestead applications were proved up, containing nearly 4000 acres. They were examined by a competent surveyor who reported that only about 300 acres in all were under cultivation and productive.

In three cases not a single acre was cultivated, and in nine cases not more than ten acres to any one. Yet two of these proved up 80 acres each, one proved up 110 acres, eighteen proved up 160 acres each, and two proved up 320 acres each, as agricultural land. One had sold a portion of his ground to miners at $60 per acre; another contained the best mine in the district; another had three operating mines on it; another sold eight acres for $3000 for mining purposes, and so on through the list.

These are only a few examples of many that might be cited to show how readily agricultural title may now be obtained to what is plainly mineral land.

Most of these men are not energetic enough to prospect their land, and by their extravagant demands bar out true prospectors, thus depriving the country of a vast amount of precious metal, for all of this ground is gold-producing.

The small area embraced within the boundaries of a mining claim shows it is not the intention of a miner to appropriate any great amount of the public domain. This apparently has been lost sight of by the makers of the regulations.

These United States mining laws are based upon the old mining district laws which were first made by the miners themselves, in the early days of the California gold fields, for an equitable distribution of the mineral land, and only what was thought sufficient for mining purposes was allowed to each one. There was no thought of any title to the ground after the mineral was extracted, and from 1849 to 1866 there was no special provision of the United States laws for the sale of lands on account of the precious metals contained therein. If the mineral was not found in payable quantities the miner was only too glad to be able to abandon it and continue his search elsewhere.

It is so now, and no one need apprehend that a mining man will accumulate "agricultural land" under the mining laws at $2.50 or $5 per acre, with an additional cost of at least $50 per acre for fees and expenses for development, unless he knows that there is sufficient mineral contained therein to recompense him.

The purpose of the present amendment is not to assist the miner in accumulating large tracts of land. It is to protect him from the schemes of designing persons, who have been attracted to his vicinity by his own industry and energy.

Many of these "homesteaders," as has been intimated, are neither miners nor agriculturists; they are either laborers or small shop or saloon keepers. They have no particular ambition, and if by a false oath or two and the expenditure of a few dollars they can obtain, with the assistance of the General Land Office regulations, such a title to land as will enable them to extort a sum in excess of their expenditures, they are only too willing to take the very remote chances of a prosecution for perjury.

It seems unreasonable that the opinion of a person, who only has learned to cultivate the surface of the ground, concerning the value of mineral deposits and geological formations, should outweigh the opinion of a person who has learned the value of such deposits by actual work among them as a miner.

Certainly agriculturists are not the best authority as to what is profitable mineral land; neither is the Register or Receiver of a Land Office.

Some instances are of record where a miner has not only been required to prove his mine "valuable," but actually "dividend paying."

There appears to be an unfair discrimination against the miner, and if the United States makes a distinction and sells the land to miners at an increased rate and in smaller quantities, why should not the Government give him such reasonable protection as this amendment is intended to afford, instead of throwing obstacles in his way and assisting the schemers?

The "agriculturist" only pays $1.25 per acre for his land and is permitted to take up 320 acres, which he withdraws forever from the public domain, but the miner must pay at least $60 per acre (including expenses), can only obtain 20 acres, and after he has extracted the mineral would be glad to restore the land to public uses, because, as before explained, he has no use for the surface.

This proposed amendment will largely tend to satisfy the miner of the intention of the Government to protect him in his work and save him from expensive litigation. If it becomes law he will continue his prospecting until he is satisfied the ground is not valuable for the mineral and then abandon it, thus restoring it to the public domain as suitable for "agricultural" purposes as it was before he made his location.

There are many acres covered by abandoned mining claims which were patented, and thus withdrawn from public use, because the miner was afraid of the "agricultural game" being played on him before he could thoroughly prospect his location.

These "hearings to determine the character of land" are reduced to writing and sent to the General Land Office, accompanied by the decision of the local Land Office. The evidence and decision is there reviewed, and if the General Land Office is of the the opinion that the mining location contains valuable mineral land, instructions are issued by the General Land Office to the local Land Office to permit the mining claimant to have a survey made at his own expense which shall segregate his mineral claim from the agricultural claim.

This segregation survey is in no sense a survey to separate the "mineral land" from the "agricultural land." No investigation whatever is made to the character of the land. The surveyor only surveys the boundaries of the piece marked on the surface as the contested mining location, calculates the area remaining in the particular legal subdivisions (of forty acres each) which surround that particular "location," and furnishes a description of the survey to the local Land Office. This is in turn sent to the Surveyor-General, who marks it on the official maps, and upon the receipt of a copy of that map the general Land Office awards all the land filed on by the "homesteaders" to him as "agricultural land," except the piece located as mineral.

Thus a patent is given to a piece of land as "agricultural" when it is evident, from the miner's location and unmistakable surface indications, that a continuation of the vein matter can be found on the other side of the "right line," which, by General Land Office rulings, based on the false affidavits of these cormorants calling themselves "homesteaders" and "farmers," is made a boundary.

There is a wide distinction between these people and the true "farmer" or cultivator of the ground. With the true farmer the true miner never has a dispute about the cultivable land; as before explained, the miner has no use for more surface ground than is necessary for the convenient working of the mine. He will gladly draw around him a population which will supply himself, family and employes with fresh provisions, and therefore cheerfully does all in his power to encourage such neighbors. Not many true farmers settle in the mineral belts, the altitude and rugged character of the country preventing profitable cultivation.

The necessity for this amendment is also shown by the history of the deep gravel mining claims of California. The mineral sought in this class of mining claims is contained in the beds of prehistoric or buried rivers, the existence of which is only apparent, on the present surface of the country, in the gulches where they have been exposed by the eroding influences of torrential streams.

These old river beds, carved out of the rock, have been partly filled in by the washings and detritus of the former

surface of the mountains, through the canyons and gulches of which they flowed. During at least three different periods great streams of lava flowed, filling these old canyons to a depth of from 300 to 1000 feet, and at least covering, in places, the whole surface of the country. Patches of soil of small area are found on top of the lava capable of sustaining a scanty vegetation. Vast areas of these deep gravel deposits are found in many counties of California and in parts of Oregon, and in most cases they are covered hundreds of feet deep under lava. Where suitably situated and free from lava capping, the gold is obtained by the hydraulic process, the whole bank then being washed away by the application of water under pressure through a nozzle. As the material passes away through the sluices various gold-saving appliances retain the gold.

Where, however, the "deep placer" is covered with lava, it is impossible to work all the material and only the lower and richer strata are mined by the drifting process. Sometimes the pay gravel is a thousand feet deep under the surface, and often many hundreds. In drifting, this auriferous deposit is reached through a long tunnel and the gravel taken out. Many of these tunnels for opening these deposits are thousands of feet in length and are run in from the sides of the ridges or "divides" to tap the auriferous channel. This is the only economical way to work these ancient river bed deposits. When the end of the tunnel finally reaches the valuable channel the auriferous gravel is breasted or drifted out, removed through the tunnel and washed on floors or crushed in "cement mills" to obtain the gold.

There are hundreds of miles of these "lava-capped divides" or ridges in California, in which are the buried channels of ancient rivers, the beds of which are filled with gold-bearing gravel. The surface of such ground has more or less soil and vegetation, but is of little value as compared with the buried gold. It seems absurd that the miner should be compelled to sink several shafts hundreds of feet deep on each twenty acres to prove what he already knows, viz., that there is a buried auriferous channel. It is too expensive to extract this gravel through shafts, the tunnel serving the purpose better, since it also affords drainage for the ground. The channel is enclosed between well-defined "rim-rock" or banks just like the rivers of the present day, and it is this channel the miner seeks. At many places along the course of the channel are other claims being worked through tunnels, and as this channel is continuous, like that of any river bed, it is perfectly reasonable for him to run his tunnel in to reach it without sinking a shaft to prove it is there, and thus entail additional and useless expense in opening the claim.

Still, an agriculturist may take up the surface of the ground he is endeavoring to reach by his tunnel, and in case of a contest the miner must show the existence of paying mineral ground. Although the miner will spend thousands of dollars to open and develop the ground and find the channel, the laws do not recognize the existence of said channel until he gets title to the ground, and he cannot get title until he proves the ground to be valuable for mineral. By the time he is able to prove that the ground may be worked out. For this reason thousands of acres of land which pay from $75 to $300 per running foot in gold go to the agriculturist for $1.25 per acre.

It will not pay to run these costly tunnels to open a single twenty-acre tract of ground, and no individual could afford to perform such work.

California alone has increased the world's circulating medium by the introduction of one thousand one hundred and twenty-five million dollars' worth of pure gold, and a very large proportion of this has been obtained from the gravel deposits.

It can be proved that to extract this from the gravel over one hundred million dollars has been invested in mines and plants.

Surely these interests should be entitled to consideration and not be discriminated against.

The Forest Hill Divide, in Placer county, is one of the numerous lava-capped ridges in California containing an ancient buried river channel. This district alone has a record of gold production of over $30,000,000. The channel pays in different drift mines from $70 to $300 per lineal foot, and when they drifted immediately under the town of Forest Hill itself the gravel paid upward of $1000 per running foot.

All of this channel of gold-bearing gravel is covered to a depth of 500 or 1000 feet with a capping of lava or cement, and the surface might all be taken up as agricultural land as far as ordinary mineral indications are concerned. There is no gold whatever in this lava cement or "pipe clay," and none is found until the gravel channel is reached. This is opened by tunnels run in from the sides of the ridge or "divide." Yet the channel, like any modern river, is continuous, though winding. There are within this one county of Placer some 200 miles of unworked auriferous gravel channels, which, judging from the parts already worked, will yield from $500,000 to $5,000,000 per mile. These deposits are found on nearly all the ridges and divides between the South Fork of the North Fork of the American and the South Fork of the Middle Fork of the American river. By following either the gravel deposits or remaining patches of gravel or capping their general courses can be traced from their source in the high Sierras to the plains.

On the Forest Hill Divide, which is only one of these, the Hidden Treasure mine has produced over $1,500,000 in gold, the channel paying $150 per lineal foot, or $1.75 per ton of gravel. The tunnel to open the deposit is between 9000 and 10,000 feet in length.

The Mayflower drift mine has yielded about $750,000 from ground paying $150 per lineal foot. The gross yield of the bottom gravel was $7 per ton. The channel was reached through 4640 feet of straight bedrock tunnel, 765 feet of incline and a bedrock gangway under the channel with twenty to forty-foot upraises to the channel bottom. Present distance trammed through tunnels from gravel breast to mill, 12,000 feet. Heavy expenditures were made in this mine before the deep channel was discovered and opened.

The Paragon mine has yielded $850,000 by drifting the bottom lead; $900,000 by drifting the upper lead; and $500,000 when worked by hydraulic process. The tunnel is 8500 feet long, and the channel has paid from $125 to $300 per lineal foot. The upper lead paid $10 per ton of gravel, and the lower lead $4.50 per ton.

These are only a few mines cited as examples of those being worked in ground the surface of which shows no signs of mineral; but the existence of a continuous channel being proven by developed mines at different points in the ridge, it seems absurd to let such valuable land pass to agriculturists at $1.25 per acre when it is clearly mineral bearing. As stated, there are numbers of these ridges in which the buried auriferous channels of rivers or streams are found, though nothing on the surface would indicate it, except to those skilled in such matters. But as the miners know by experience where to search, it seems reasonable to let them prove the probable existence of mineral from the adjacent mines being worked.

The large amount of material to be removed in proportion to the gold obtained necessitates conducting the work on a large scale, and therefore the larger companies obtain as much as possible of the channel by consolidating claims, until some of them now own strips of land, believed to contain deep gravel channels, from one to five miles long, and have invested from one to three millions of dollars in the property and plant alone.

As an example, the Mayflower Company in Placer county, above referred to, owning about one and one-half miles of a buried river channel, has run over twelve miles of tunnels and drifts, averaging in cost about twenty dollars a foot. At this time the lava cap is comparatively thin, being five hundred feet thick. If they had been limited to twenty or forty acres of this ground they could not have reached it. Common sense would show that it would not pay to sink a prospect shaft through five hundred feet of lava rock on an uncertainty, neither would they have dared to run their long tunnel for so small an area, even if they could have obtained ground for an entrance.

Moreover, they could not have made a true discovery on the surface, because this lava cap covers all these deep placers, and there is no natural indication of mineral except at the banks of the modern rivers.

They were able to predict from the developments in adjacent claims that the channel was at a certain place, and did not hesitate to expend this large sum on the strength of that prediction. This is not an only case; there are several with lava caps more than one thousand feet thick, and longer tunnels.

Nearly all of these deep gravel placers were prospected and developed by the presumptive evidence furnished by developments of adjacent ground.

In a report of the State Mineralogist of California, in support of presumptive evidence, this appears:

"One of the owners of the Mountain Gate mine at Damascus, California, became convinced that the channel gravel being worked in that mine was identical with two isolated gravel deposits known, respectively, as the Gas Hill claims and the Big Gun mine at Michigan Bluff, the first named being six miles south, the other nine miles south of the Mountain Gate works. Proceeding on that theory, he obtained the grade and direction of the channel, projected it four miles to the south from the Mountain Gate mine in the direction of Gas Hill, and toward the most favorable point in the line of projection constructed a tunnel to come under the channel a certain estimated depth and to reach it in the estimated distance, provided it maintained the grade and line of projection. The trial projection proved substantially correct, and the channel was located in its anticipated position, though there was no surface indication of its presence. The Hidden Treasure mine, so discovered, has developed into one of the best paying properties in Placer county.

"The celebrated Bald Mountain mine at Forest City in Sierra county was discovered by the application of the same principles at an earlier date. The Live Yankee drift mine had been worked through the ridge from Alleghany to Forest City, a distance of about a mile: on the Alleghany side the channel was cut off by Kanaka canyon; on the Forest City side by Oregon gulch. It was successfully projected across this latter, and the Bald Mountain mine, under the mountain of that name, discovered; this latter, in its turn, led to the discovery of the Ruby drift mine, a continuation of the Bald Mountain mine, three miles to the northwest of where the latter was discovered, on the opposite side of the mountain."

After many other similar descriptions of discoveries of mines, and the methods used by the engineers, the article continues:

"By its use it is possible to determine in advance of doing any underground work on the claim:

"1. The approximate location of the line of the bed of the channel.

"2. The approximate elevation of the bed at any desired point.

"3. The location of inlets, outlets or breakouts, and a reasonable certainty of distinguishing between them.

"4. * * * *

"5. The determination of the size of the channel and the probable extent of its pay lead. This being of advantage in estimating the probability of yield sufficient to warrant the necessary outlay of capital in development."

This is followed by several other similar reasons.

In the case of Smelting Company *versus* Kemp, 104 U. S. 636, Mr. Justice Field says:

"The object in allowing patents is to vest the fee in the miner, and thus encourage the construction of permanent works for the development of the mineral resources of the country. Requiring a separate application for each location, with a separate survey and notice, where several adjoining each other are held by the same individual, would confer no benefit beyond that accruing to the land officers from an increase in their fees. The public would derive no advantage from it, and the owner would be subjected to onerous and often ruinous burdens. The services of an attorney are usually retained when a patent is sought, and the expenses attendant upon the proceedings are in many instances very great. To lessen these as much as possible *the practice has been common for miners to consolidate*, by conveyance to a single person or an association or company, many contiguous claims into one, for which only one application is made, and of which only one survey is had. Long before patents were allowed, indeed, from the earliest period in which mining for gold and silver was pursued as a business, miners were in the habit of consolidating adjoining claims, whether they consisted of one or more original locations, into one, for convenience and economy in working them. It was, therefore, very natural, when patents were allowed, that the practice of presenting a single application with one survey of the whole tract should prevail. It was at the outset, and has ever since been, approved by the Department, and its propriety has never before been questioned. *Patents, we are informed, for mining ground of many millions of dollars, have been issued upon consolidated claims*, nearly all of which would be invalidated if the positions assumed by the defendants could be sustained.

"It was urged on the argument that a patent for each location was required to prevent a monopoly of mining ground, to prevent — to use the language of the counsel — the public domain from being 'monopolized by speculators.' The law limiting the extent of mining lands which an individual may locate has provided, so far as it was deemed wise, against an accumulation of them in one person's hands. It could not have prohibited the sale of the location of an individual without imposing a restriction injurious to his interests, and in many instances destructive of the whole value of his claim. *Every one at all familiar with our mineral regions knows that the great majority of claims, whether on lodes or on placers, can be worked advantageously only by a combination among the miners, or by a consolidation of their claims through incorporated companies.* Water is essential for the working of mines, and in many instances can be obtained only from great distances, by means of canals, flumes and aqueducts, requiring for their construction enormous expenditures of money, entirely beyond the means of a single individual. Often, too, for the development of claims, streams must be turned from their beds, dams built, shafts sunk at a great depth and flumes constructed to carry away the debris of the mine. *Indeed, successful mining, whether on lode claims or placer claims, can seldom be prosecuted without an amount of capital beyond the means of the individual miner.*

"There is no force in the suggestion that a separate patent for each location is necessary to insure the required expenditure of labor upon it. The statute of 1872 provides that on each claim subsequently located, until a patent is issued for it, there shall be annually expended in labor or improvements one hundred dollars; and on claims previously located an annual expenditure of ten dollars for each one hundred feet along the vein; but where such claims are held 'in common' the expenditure may be upon any one claim. As these provisions relate to expenditures before a patent is issued, proof of them will be a matter for consideration when application for the patent is made. It is not perceived in what way this proof can be changed or the requirement effected, whether the application be for a patent for one claim or for several claims held in common. *Labor and improvements within the meaning of the statute are deemed to have been had on a mining claim, whether it consists of one location or several, when the labor is performed or the improvements are made for its development, that is,* TO FACILITATE THE EXTRACTION *of the metals it may contain, though, in fact, such labor and improvements may be on ground which originally constituted only one of the locations*, as in sinking a shaft, or be at a distance from the claim itself, as where labor is performed for the turning of a stream, or the introduction of water, or where the improvement consists in the construction of a flume to carry off the debris or waste material. It would be absurd to require a shaft to be sunk on each location in a consolidated claim when one shaft would suffice for all the locations; and yet that is seriously argued by counsel, and must be maintained to uphold the judgment below."

A decision by the Secretary of the Interior now attempts to limit a location of a placer claim to the twenty acres around a discovery on a placer claim, and this was on an appeal from a decision of the Commissioner of the General Land Office reversing a decision of the Register of the local Land Office reducing an application for a one hundred and sixty acres location to ten acres, which was based upon a location made upon unsurveyed land, and accompanied by a special official survey. This was a special case, but the language of the Secretary's decision makes it apply to all placer claims, and it is being so used by the local offices.

On May 26, 1894, the U. S. Supreme Court, in the case of R. V. Bardon et al. *versus* Northern Pacific Railway Company, on appeal from the Circuit Court of Montana, said:

"The territory was known to embrace great quantities of minerals, including gold and silver, and in all grants to railways mineral lands * * were excepted, and such grants were never known to pass title to minerals. It was impossible, at the time of the grant, for Congress to know what lands contained minerals. * * *

"The United States could not have meant * * * to give away the title to such imperial wealth, but left the discovery of minerals to future explorations. It was a certain rule of grants that nothing was conveyed by implication except what was absolutely essential to the enjoyment of the grants." * * *

Now, as the railroad lands are intended to be sold as agricultural lands, it is evident that the Supreme Court does not believe that mineral lands should be used except for mining purposes, and this decision will surely be applicable to the "homesteaders."

OUR PIPE

IS FOR SALE.

For Hydraulic Mining and Irrigation Purposes Our Sheet Iron and Sheet Steel Riveted Water Pipe Is Unexcelled.

We Have Also a Large Line of the MATHESON JOINT (Lap-Welded) Pipe, for Which We Are Agents.

Our Prices Are Low; Our Pipe Is Superior, and We Want More Business. May We Quote You Prices?

PIPE FITTINGS, TOO.

Department Rulings and the Miners.

The following is the speech delivered before the State Mining Convention by Mr. A. H. Ricketts:

It is well known that the mining law as it is now administered is not conducive to the stability of the miner's possessory title when his rights are antagonized by the claims of the agriculturist or lie within the limits of a railroad grant. This unsatisfactory condition of affairs is directly traceable to the position assumed by the Land Department of the United States, which has become a *quasi* judicial tribunal exercising legislative functions; and unfortunately its rulings and practice are too often made the subject of favorable judicial decision. The Supreme Court of the United States, however, often corrects Department errors and compels it to modify its procedure in matters affecting the public lands. And that court has recognized the necessity of further legislation to enforce upon it a stricter regard of its duties in respect to the issuance of patents which are repeatedly issued without the investigatiou and consideration which the public interest requires. But the owner of patented mining ground has always been reasonably secure in his holdings.

The machinery of the law called into action in the attempt to "break," or more technically speaking, to set aside or annul a patent, is more cumbrous and expensive than is an attempt to wrest an unpatented mining claim from its owner under the pretense that it is more valuable for agricultural than for mining purposes. The question of the relative value of lands arises in the Land Department whenever these two classes of claims come in conflict, and is a rule of decision created by the Land Department and adopted by the courts. Briefly, this rule is that in contests affecting the character of the ground, if the land is worth more for agricultural purposes than for mining, it is not mineral land, although it may contain some measure of the precious metals; and, in determining this question, no contingencies, possibilities or even probabilities are considered, but the "proof of the mineral character of the ground must be specific and based upon the actual production of minerals. It is not enough to show that neighboring or adjoining lands are mineral in character, or that the land in controversy may hereafter develop minerals to such an extent as to show its mineral character, but it must be shown as a present fact that the lands are mineral, and this must appear from actual production of mineral, and not from a theory that the land may hereafter produce it. "Indeed," said a learned United States District Judge, "mere mineral prospect or hope, however pleasing or auspicious, shall not keep the land from the plow or the pruning-hook, and it is well that it does not." The Supreme Court of the United States lays down the doctrine that surface indications of the existence of veins do not constitute a mine. It does not even prove that the land will ever be, under any conditions, sufficiently valuable on account of its mineral deposits to be worked as a mine. The mineral claimant, when contest is forced upon him by the agriculturist, must prove: First, that the land is valuable for minerals; and second, that it is more valuable for mining than for agricultural purposes. If the land is valuable for minerals under the law, it should only be sold as mineral land without reference to its relative value for agricultural purposes. This question of comparative value of the land is the outgrowth of judicial and department legislation before referred to, and it is so deeply rooted that only an act of Congress can eradicate it.

What the nature and extent of the deposit of precious metals is which will make a tract of land "mineral" or constitute a "mine" therein, within the statute, has not yet been judicially determined; but the Land Department holds that "the mere fact that portions of the land contains particles of gold would not necessarily impress it with the character of mineral land. It must at least appear that it contains metal in such quantities as to make it available and valuable for mining purposes;" or, in other words, "that to constitute mining land it must also be shown it will pay to mine by the usual mode of mining." "The statute," says a learned judge, "does not reserve any land from entry as a homestead simply because some one is foolish or visionary enough to claim or work some portion of it as mineral ground without reference to the fact of whether there are any paying mines on it or not. Nothing short of *known* mines on the land, capable under ordinary circumstances, of being worked at a profit as compared with any gain or profit that may be derived therefrom when entered under the homestead law, is sufficient to prevent such entry." In other words, presumptions are indulged in on behalf of the rancher, but not of the miner. The agriculturist does not have to base his right upon the actual production of any crop which may be disposed of at a profit; he may rest his claim upon conjuncture, and the possibilities of his neighbors may constitute the probabilities of his own efforts towards success. It is true that all mines do not pay, so is it true that all farms or ranches do not pay; and it is safe to assert that there are more abandoned ranches than there are abandoned mines within this or any other mining State. In order to uphold his rights, the miner must prove that his mine is a "known" and a "paying one," but no proof is required from the agriculturist that his ranch is or ever will be a paying one. The opinion of farmers on the future capabilities of its vegetable or vine-growing possibilities, say, is sufficient to make it valuable for agricultural purposes in the eyes of the Department. For the illustration of this fact I refer to the notorious Manzanita case. This property is at Sulphur Creek, and has been worked for the last thirty years as a mining claim. About two years ago it fell a prey to an agricultural claimant, who discovered that no patent had been issued to or applied for by the mineral claimants.

The homestead applicant filed an affidavit in which he stated, among other things, that he is well acquainted with the character of said land, "that there is not to his knowledge within the limits thereof, any vein or lode of quartz or other rock in place bearing gold, silver, or cinnabar, or any other valuable mineral deposit; that no portion of said land is claimed for mining purposes under the local customs or rules of miners or otherwise; that no portion of said land is worked for mineral during any part of the year by any person or persons, *that said land is essentially non-mineral* land, and that his application therefor is not made for the purpose of fraudulently obtaining title to mineral land, but with the object of securing said land for agricultural purposes." This lying affidavit, this perjured testimony, was met at a hearing duly had before the local Land Officers by proof that the lands embraced in the homestead application, and which were claimed by the homestead applicant as essentially non-mineral land, had been worked continuously for over thirty years as mining ground; that hundreds of feet of shafts, cuts, tunnels, drifts and crosscuts had been sunk and run; that by these means thousands of tons of ore had been developed, which ran from $1.50 to $32.50 a ton in gold and from one-quarter of one per cent to sixty per cent in quicksilver; the cost of mining and reducing which was as low as sixty-five cents per ton. That the amount of ore uncovered was so enormous that it would require years to reduce it with the present machinery upon the ground, which was capable of reducing 120 tons of ore every twenty-four hours, or a minimum value of about $50,000 a year. That Professor Becker, the Government Geologist, had reported, in Vol. 13, U. S. Geological Surveys, that "one of the most interesting deposits in the world is the Manzanita mine on Sulphur creek. This ore consists of cinnabar and gold, which are sometimes in direct contact, and some metacinnabarite. The Manzanita forms a link between cinnabar and gold mines, and shows that both minerals may be deposited from the same solutions, not merely in traces but in notable quantities." It was further shown that this "essentially non-mineral land" contained innumerable veins and veinlets carrying gold and cinnabar in greater or less quantities, forming as it were a reticulated mass which in its entirety formed a zone upward of 150 or 200 feet in width and over 2000 feet in length.

It was further shown that the land is very hilly and sterile and its soil is permeated by chemicals and minerals to such an extent as to kill all vegetation. That there is so much sulphur in the ground that its odor can be detected a mile away, and that the land would not raise anything but hay, and not more than a ton to the acre at that, which under the most favorable conditions would make the value of the crop about $2400 a year. Yet the officers of the local Land Office decided that the land was more valuable for agricultural than for mining purposes, and they made the astonishing statement as one of the reasons for such a remarkable decision that "the Manzanita Company had not taken sufficient precaution to protect its valuable mine." What precautions the company should have taken to protect its valuable mine does not appear, but possibly its laches consisted in not applying for an agricultural patent. The fact that a "known mine" existed was proved, the comparative value was shown, and the ratio thereof was, say twenty to one in favor of the mine owner. An appeal to the Commissioner of the General Land Office resulted in an affirmance of this outrageous abrogation of the mining law; the Commissioner saying that the contestant failed to show said land to be more valuable for minerals than for agricultural purposes. We hope that this decision is the Commissioner's by adoption only; for it was evidently prepared by some one who has as much knowledge of a mine as a dog has of the stellar constellation. If this case serves as a beacon light to warn the owner of an unpatented claim of the dangers which surround him; if it serves to impress upon this convention the necessity of curbing the grasping power of the agriculturist and the perversion of the mining law by the Land Department, by appropriate legislation, this case is not without its value. The mining law must be so amended that the rights of the miner shall no longer be subjected to the vagaries of the rancher or continue to be the foothall of the Land Department of the United States.

The subsidized transcontinental railroads have not been a whit behind the agriculturist in efforts to secure the mineral lands, and they, like the agriculturist, take no heed of miners' locations or his possessory rights. For example, take the case of the Eagle Bird mine, known in the law books as Francouer v. Newhouse. Its patent was issued to cover a portion of an odd numbered section. This did not deter the Railroad Company from making its deed of this patented mine as agricultural land to one Francouer, who promptly brought suit in ejectment against the mine owners. The question of the mining patent cut considerable figure in the case, and incidentally it appeared that the Railroad had sought to patent the property as agricultural land, notwithstanding the existence of the mining patent. Think of it, a patent upon a patent, and the Government supposed to have a different title for each applicant. The case was tried before a jury and resulted in a victory for the mine owner. Since that time, and because so many points of law were settled against the Railroad Company, but little, if any attempt, has been made to secure such properties through the courts, but the fight is going on all the time and the forum chosen is one where juries are unknown and regulations are promulgated by which the Railroad Company is made the arbiter of its own case.

In no other tribunal than that of the Land Department could such a thing be possible. But the present regulations have just that effect and the Bardeu decision is supposed by it to sanction such a course. It really does nothing of the kind. It announciates no new principle of law, but does uphold the Land Department in its practice and contention that matters relating to public lands and the selection thereof are within its jurisdiction until patent issues. Mr. Justice Field, who delivered the opinion of the Supreme Court of the United States in the Barden case, in the course of the opinion says: "As justly observed by counsel for the defendant in their very able brief, 'the reservation in the grant of mineral lands was intended to keep them under Government control for the public good, in the development of the mineral resources of the country, and the benefit and protection of the miner and explorer, instead of compelling him to litigate or capitulate with a stupendous corporation and ultimately succumb to such terms, subject to such conditions, and amenable to such servitudes as it might see fit to impose.' * * * "An affirmance of the judgment in this case would enlarge the grant of the Government against its oft-repeated exception of mineral lands, and give to the plaintiff the vast mineral wealth of the States through which the grant passes. It would render the plaintiff corporation imperial in its resources—one that would outshine 'the wealth of Ormus and of Ind.' And, as counsel observes, the same rule would apply to all our transcontinental railroads and give to them nearly all our mineral lands, when Congress has time and again declared that they should have no mineral lands."

In the very teeth of this opinion, and because Mr. Justice Field took occasion therein to say, "The fact remains that under the law the duty of determining the character of the lands granted by Congress, and stating it in instruments transferring the title of the Government to the grantees, reposes in officers of the Land Department," such officers have issued new and additional instructions affecting the selection of lands within the railroad grants, which have but little regard for the interests of the Government or of the mineral claimants. These rules could not better serve the railroads if they were of their own creation and adopted at some transcontinental railroad convention. These rules provide that "where the lands selected by the company are within a mineral belt or proximate to any mining claim the railroad company shall be required to file with the local Land Office an affidavit by the land agent of the company, which affidavit shall be attached to said list when returned, setting forth in substance that he has caused the lands mentioned to be carefully examined by the agents and employes of the company as to their mineral or agricultural character, and that to the best of his knowledge and belief, none of the lands returned in said list are mineral lands." * * That notice of the railroad's selection shall be given by advertisement, and if no protesting voice is raised within the sixty-days' period of newspaper publication, such selections are to be patented as agricultural lands.

The agents and employes designated by the railroad companies to determine the character of the land may, at the option of their employer, remain unknown to the people and the Government.

They are not required to make a report except to the railroad company, which report need not be in writing or under oath, and its character may well be imagined.

The affidavit required of the land agent of the railroad company based upon such report is not only an *ex parte* statement, but the rankest kind of hearsay evidence, which would not be admissible in a court of law. But it is sufficient in the eyes of the Land Department to control its action in the disposal of the public lands and to cast the burden of proof upon the party who disputes its truth.

It is true that contests and protests are provided for by the regulations under discussion, but under such restrictions and conditions as to render such action of but little value.

The notice to be given of the railroad's selections is so vague that the opportunity to even take such steps may be lost. The notice is to be published in such newspapers as shall be designated by the Commissioner of the General Land Office. These may be the Monarch of the Dailies or the Poker Flat Bazoo, either or both of large circulation, but neither, perhaps, within hundreds of miles of the selected lands, which are to be described by townships only and without naming the adverse claimants therein. No personal service of this notice is to be given, no posting of notice on the lands is to be had; nothing but a designation by township lines. This pretended notice is tantamount to no notice at all. When a miner seeks a patent for his mining claim the Land Department regulations affecting his application are of a most stringent character and most rigidly enforced, with wholesome regard for possible adverse rights. And the local land officers and those of the General Land Office at Washington vie with each other in efforts to wholly reject or return his application upon the most trivial pretexts. An application for patent has been *rejected* because the local land officers could not determine therefrom whether it created *any* conflict with prior agricultural patents. An application for patent has been *rejected* by such officers because some twenty odd years before some one had commenced proceedings for a patent for a portion of the same ground by having it officially surveyed, and then ceased to proceed with the matter. The fact that a valid relocation had been made by the present claimant cut no figure with them. An omission of the course and distance of the line connecting the mine sought to be patented with the system of public surveys in the notice of application has been sufficient to put the claimant to the expense of commencing his proceedings anew. And it was not until a decision of the Supreme Court of the United States compelled such action could a consolidated application be filed in the Land Office. Why the railroad companies are not subjected to like rules when applying for agricultural patents is one of the more or less absorbing mysteries of the day.

The extraordinary attitude of the Land Department toward the miner cannot be too strongly condemned. Its power in the matter of the disposition and selection of the public lands must be curtailed. Its usurped power to legislate and practically repeal the Act of Congress by so-called regulations and circular instructions must be taken from it. Its power to favor one class of land claimants more than another must be wholly done away with. The procedure in the matter of contests and protests between the miner and the farmer must be conducted under the rules of evidence and in accordance with the practice of courts, if it is to continue to act as a *quasi* judicial tribunal; but as contests between miners have to be taken to a court of competent jurisdiction, so also let contests involving the character of land be taken there. It was Congress which gave to the Land Department its power, which has resulted in complex, uncertain and unsatisfactory rules, and a mode of procedure too often made the vehicle of injustice and the cloak of the blackmailer. It is therefore to Congress that we must appeal to right the abuses now existing; and it is the duty of this convention to hammer at its door with such vehemence that there will be no mistaking your meaning.

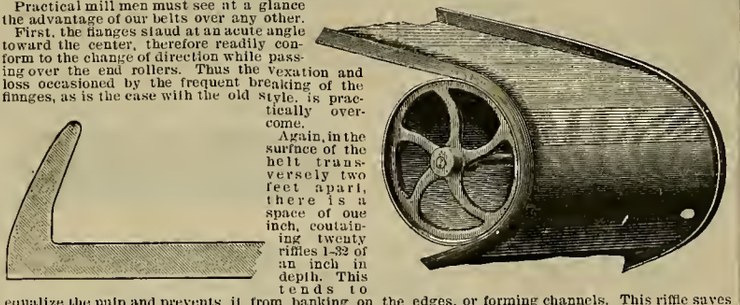
Office and Warerooms: 9 FREMONT St., San Francisco, Cal.
Or, Address the Company at its Denver Office.

Blasdel Improved Concentrating Belt.
We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.
Practical mill men must see at a glance the advantage of our belts over any other. First, the fingers stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the fingers, as is the case with the old style, is practically overcome.
Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.


H. G. BLASDEL, JR., Manager,
419 California Street, Haywards Building..... San Francisco.

FRANCIS SMITH & CO.,
—MANUFACTURERS OF—
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

....The Greatest Book on Petroleum in any Language....
JUST READY.
PETROLEUM:
Its History, Origin, Occurrence, Production, Physical and Chemical Constitution, Technology, Examination and Uses; together with the Occurrence and Uses of Natural Gas. Edited chiefly from the German of Prof. Hans Haefer and Dr. Alexander Veith, by William T. Brannt, author of "A Practical Treatise on Animal and Vegetable Fats and Oils." Illustrated by 3 plates and 281 engravings. 739 pages, 8vo. Price..... $7.50
ABSTRACT OF CONTENTS. Chapter I. Introduction: History of Petroleum: History of the Petroleum Industry in the United States, Galicia, Roumania, Russia and other countries. II. Division and Nomenclature of Bitumen. III. Physical and Physiological Properties of Petroleum. IV. Chemical Constitution of Petroleum. V. Occurrence of Petroleum. VI. Origin of Petroleum. VII. Boring, Conveyance, Transportation. VIII. Crude Oil. IX. Manufacture: Distillation, Condensation, Refining, Continuous Distillation, Production of Lubricating Oils. X. Manufacture of Paraffine. XI. Methods of Testing Oils. XII. Uses and Properties of Petroleum. XIII. Natural Gas and Gas Oils. Appendix. Index.
☞ *This volume will be sent by mail, free of postage, to any address in the world, or by express C. O. D., freight paid, to any address in the United States for $7.50.*
☞ *A circular of 8 pages, with specimens of the illustrations, showing the full Table of Contents, will be sent free to any one furnishing his address.*
WE ALSO PUBLISH
The Techno-Chemical Receipt Book:
Containing Several thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Elsner, Heintze, Mierzinski, Jacobsen, Koller, and Heinzerling. With additions by William T. Brannt and William H. Wahl, Ph.D. (Heid.), Secretary of the Franklin Institute, Philadelphia. Illustrated by 78 engravings, one volume, over 500 pages, 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.
Price $2.00, free of postage to any address in the world.
☞ *A circular of 32 pages, showing the full Table of Contents of this important Book, sent by mail free of postage to any one in any part of the World who will furnish his address.*

The Nicaragua Canal.

Last Saturday a conventiou of public organizations assembled by invitation in the hall of the Chamber of Commerce to consider the prompt construction of the Nicaragua canal.

The Geographical Society of the Pacific, represeuted by a committee with Professor Davidson as chairman, sent in a most interesting report, showing the great saving of time and distance to be brought about by the caual in transportation by water between California and the East. In case of war our cruisers could be quickly shifted from one coast to the other as needed, thus doubling the efficiency of our navy.

Senator Geo. C. Perkins, Mr. Geary and others addressed the meeting, showiug in many points the bearing which the completion of this great waterway would have on the interests of our State.

Much diversity of opinion was brought out as to the best method to pursue. Some of the speakers insisted that our Government should coustruct the canal, the fact that such action is prohibited by treaty being believed to be susceptible of modification. It was urged that no corporation should have anything to do with it.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

UNITARIAN LITERATURE sent free by the Channing Auxiliary of the First Unitarian Church, cor. Geary and Franklin Sts., San Francisco. Address as above. Mention this paper.

A MINING ENGINEER

Of a large western mining company, with extensive experience in working quartz and placer mines, desires a situatiou as manager or superintendent in California. Address J. T. C., care of MINING AND SCIENTIFIC PRESS.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Has been established under a thoroughly qualified instructor. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

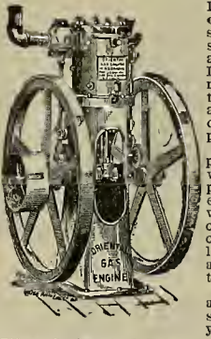
ACTUAL BUSINESS PRACTICE.

Established 1863. PACIFIC Business College, 320 POST ST. SAN FRANCISCO. Day and Evening Sessions.

Rates of Tuition Very Moderate.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, President.

The Oriental Gas Engine



IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

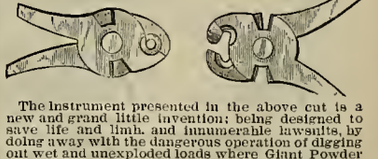
The Oriental Launch is Perfection.

M. A. GRAHAM,

Inventor and Manufacturer,

105 Beale Street..... .....San Francisco

GIANT POWDER FURE CAP FASTENER.

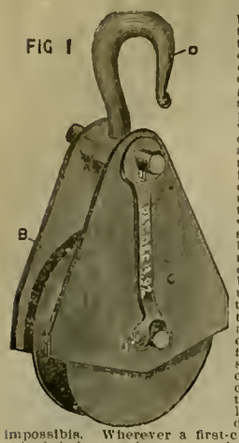


The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads where Giant Powder is used in mining. The instrument crimps the cap on the end of the fuse, *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. They are neatly gotten up, of the finest cast steel, and nickel plated. Price $1.50 each.

MOODEY & SHERWOOD Fresno, Cal.

IMPROVED STEEL SNATCH BLOCK.

FIG 1



This is admitted by experts to be the best block of the kind in existence. Being made of the best quality of refined steel, it gives greater strength in proportion to its weight, and the owening side being a solid piece, does not detract from its strength as in other blocks. In using wire cable, the damage to which the cable is subject in other blocks by jamming between the cheek plate of the block and rim of the pulley is entirely overcome, as the guiding ribs B, as shown in the cut, are snugly fitted to the inner surface of the cheek plates and completely cover the rim of the pulley, making accidents of this kind impossible. Wherever a first-class block is required, it is superior to any other. *Catalogues sent free.* Address, CALIFORNIA STEAM PULLER CO., 82-84 Zoe Street, San Francisco, Cal.

ALASKA TREADWELL GOLD MINING COMPANY
Alaska Mexican Gold M'g. Co.

Douglas Island, Alaska, July 31st. 1894.

William J. Chalmers Esqr.
Pres. Fraser & Chalmers.
Chicago. Ill.

Dear Sir:-

Your letter of July 7th. is duly received.
In regard to your enquiry regarding our Riedler Compressor, supplied by your Coy, over eight months ago, I must say, that the Compressor is giving excellent results, and every satisfaction, while running either by steam, or water power.
During the last twelve years, I have seen operated, and have operated, many different makes of air Compressors, including the Eclipse, Reliance, Burleigh, National, Rix, & Firth, Ingersoll Sargent, etc. etc. and in no instance, have any of the above given the results of the Riedler. Therefore, I have no hesitation in saying that the Riedler, is the best, and most economical Compressor on the market today. We have made comparitive tests here, of the Ingersol Sargent, and Riedler, which show, greatly in favour of the Riedler.
Yours very truly,

Robt. Duncan Jr.
Supt.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.
Price $8.00 postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

By J. S. PHILLIPS, M. E.

The work is divided into four parts - Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

REVERSIBLE DRIVING GEAR FOR CARS.—James Hopkirk, San Francisco. No. 529,268. Dated Nov. 13, 1894. The object of this invention is to provide a mechanism for transmitting power from any suitable engine, motor or other source, to the traction wheels of a car in such a manner that it may be driven in either direction, quickly reversed or brought to a standstill without interfering with the continuous running of the motor in one direction. It consists of a truck frame having traction wheels and engine shaft adapted to rotate continuously in one direction, gear wheels meshed together and fixed upon shafts journaled upon the frame, and a gear upon the engine shaft engaging one of these gears so that they are rotated in opposite directions; sleeves turning loosely upon the gear shafts and friction clutches upon the shafts and sleeves, one of said clutches being engaged to rotate the sleeve in one direction and the other clutch engaged to rotate said sleeve in the opposite direction; a shaft carrying a gear which engages the gears upon the sleeves and is rotated in opposite directions by the engagement of the clutches and pulleys with endless flexible hands connecting the shafts, with suitable means for maintaining an equitable tension of the driving belts.

BOX WIRING AND HOOPING MACHINE.—Edward A. Cooley, Cloverdale, Cal. No. 529,247. Dated Nov. 13, 1894. This invention relates to an apparatus which is adapted to apply hoops, bands or wires around boxes for the purpose of strengthening and securing them. It consists of vertical main frames adjustable to and from each other, having their upper portions adapted to swing outwardly, adjustable supports carried by the upper portions upon which the box rests, means for supplying the banding material, a lever carrying a clamping device at its upper end for grasping the banding material and a foot lever connected with the lower portion of said lever whereby the banding material is drawn to the proper tension when secured upon the box.

CARRIER FOR CAN-MAKING MACHINE.—R. D. Hume, Gold Beach, Oregon. No. 529,269. Dated Nov. 13, 1894. This invention relates to an attachment for can-making machines which is adapted to move the can intermittently through the various stages and operations to which it is subjected in the process of forming. It consists of longitudinally reciprocating toothed plates or bars moving upon each side of the horn upon which the can bodies are to be advanced, mechanism by which the plates are alternately moved in transverse planes toward each other so that the teeth engage the can bodies to be advanced and are then moved forward to complete the stroke, then separated from each other, so that the teeth are clear of the can bodies and returned to their first position.

SAW HANDLE.—M. M. Cope, Noyo, California. No. 529,063. Dated Nov. 13, 1894. This handle is intended to be readily applied to and removed from different saws. The device comprises a ring at one end for receiving the handle bar, said ring being formed with an externally threaded shank having a cross hole near its base, a sleeve or follower upon the shank, a head piece and a hinged clamp adapted to engage the saw blade between them, said headpiece having a head entering the shank of the handle ring and secured by a cross pin, and a nut on the shank having means for engaging the follower, whereby the latter is set up to hold the clamp and head together and withdrawn to relieve them.

The Miners' Convention.

(*Continued from page 324.*)

each County Association in proportion to its membership—I mean all the transactions.

This motion was duly seconded and carried.

THE CHAIRMAN: Gentlemen. I take pleasure in introducing to you Senator Cross. [Senator Cross' address will appear in our next issue.—ED.]

At the opening of the afternoon session Judge Niles Searles addressed the convention as follows:

Mr. President: My duties, gentlemen of the convention, have been of such a character that I have had but little opportunity to be here with you, and I do not expect to be long with you on account of these duties elsewhere. Permit me to congratulate you upon the number and seeming men of character who compose this body. You have met here not simply in the interest of the miners of the State of California, but in the interest of a business which redounds to the welfare and the profit of all the people of this commonwealth.

In your persistent efforts to revive mining, in all its pristine vigor, you are accomplishing a work which will redound not only to your advantage as miners, but to the best interests of all the people of California.

At the outset of what may be termed the "contest," which has culminated in the present Miners' Association, we were much in the condition of the ax-man who goes into the forest to fell the mighty trees. He finds it necessary for his own security to first remove the underbrush, which tends to retard his progress and may divert his keen steel from its course to its own injury and destruction. It was a good deal so when this contest arose. There were a good many mining questions involved. The people at large did not view it in all its proportions when a few of the leading hydraulic mines were interdicted by the action of the courts; a good many others anxious to procure their conviction, it is just possible, consented for a consideration to receive permits to go on with their work. One result of this was that the people who said that hydraulic mining occupied an inferior place in the economy of the prosperity of this State saw but little lull in the volume of business which was being transacted. The output of gold continued pretty large, and they did not realize the barren results which would follow a complete cessation of that branch of industry. When, however, the present condition was created on the part of the General Government, composed as it is of men of high character and rare intelligence, a different state of things occurred. Hydraulic mining then, for the first time, really ceased. The result has been felt from one end of this State to the other until to-day men realize the effect which follows that cessation, and now for the first time we are able to take up the proposition, divested of all collateral questions, "Can hydraulic mining be prosecuted and the interests of navigation and of the agriculturist at the same time be conserved?" We answer that in the affirmative, and say that to answer it otherwise would impeach the genius of the American people. What under the laws of nature can be accomplished, the engineer can accomplish with sufficient means at his command.

That the road will be blazed out through and by which the interests of all the people will be conserved, through your instrumentality and influence, I have faith to believe. Much that has been done, it seems to me, is a sequence of the wisdom which you have shown in the selection of officers who have controlled this organization during the last two or three years. It has been your good fortune to have at the head of this organization a gentleman who has inspired confidence in the people in all parts of the State; a gentleman to whom men, whatever their views might be, could turn with approbation; a gentleman who has conducted your affairs in that spirit of honesty and economy which has redounded, and if continued will redound to the interest not only of this Association, but to the benefit of every interest involved in this State. I allude, gentlemen, to the Hon. Jacob Hart Neff, your worthy president. And knowing as I do full well by many years of experience, associated with him and engaged as I have been more or less in the transaction of public business in this Association, I take great pleasure in placing his name before the convention for president for the ensuing year.

MR. MCBRIDE: Gentlemen of the convention: The Hon. Jacob Hart Neff has been placed in nomination as president of this Association for the ensuing year. Does the convention wish to present any other nomination? Do I hear a second to the nomination already made?

MR. SHERWOOD, of Marysville: Mr. Chairman, before you put the question, will you allow me to say a word? I come here from Marysville. I have lived there thirty-five years. I wear the badge today of the Miners' Association, and I want to say to you here, gentlemen, that the choice of this convention, so far as it has gone, should be the unanimous choice of not only the miners of California, but the agricultural interests, that he should be the chairman and the leader of this movement. You have produced that which you see in the foreground, sir, the shaking of hands between the valley and the mountains. I second the nomination of Mr. Neff for president of this Association for the next term.

The question was then put by Major McBride and unanimously carried.

Three cheers were then given for Hon. Jacob H. Neff.

MAJOR MCBRIDE: Hon. J. H. Neff, you have been re-elected, and properly, too, as president of this Association. Now take the chair.

PRESIDENT NEFF: Gentlemen of the convention, would that I possessed language to express the feelings of my heart to you for this mark of your esteem. I had hoped, and so expressed myself to a number of gentlemen who are delegates here, that some other person might have been selected to carry on the work that I have endeavored, with the assistance of the Executive Committee, to carry on for the past three years. I can say, and say it honestly, that my whole heart, every nerve I possess, has been engaged and employed in this undertaking. With what success we have met, you gentlemen are apprised of. I, of course, feel the time approaching of advancing years. I am not the man I was ten or fifteen years ago, but still I have sufficient vigor and manhood left to carry on this work for the ensuing year, if my good Maker will permit me to do so. Bear in mind, however, gentlemen, that we require your assistance in this work. It is a glorious undertaking. If we can bring to bear the intelligence, the industry of the miner, assisted by the commercial bodies and other businesses of this State, we will surely succeed.

To my good friend, Judge Searles, who so flatteringly presented my name here, I can but say, My good old friend, thank you; and to my friend Sherwood, of Marysville, whom I have always esteemed as one of my best and earliest friends, although somewhat covered up with slickens at times, I thank you. Mr. Sherwood has known me for years, and knows my efforts have always been in the right direction, and when I took hold of this work, at the urgent solicitation of some of the valley people, I did so hoping to bring about a feeling of accord in the two great industries, mining and farming, and I hope to God that the initiative now started will succeed in the end.

THE CHAIRMAN The next business in order will be the selection of the Secretary. Nominations are now in order.

MR. SEARLS (of Nevada county): Mr. Chairman and gentlemen of the convention, I shall endorse what has been said about your chairman. You all know him. I believe that we might have searched the State of California over, and not found another man on whom we could all have united as we could on Jacob Hart Neff, that has combined all interests. We all have confidence in him and we know he is the right man in the right place. But, gentlemen, you are the representatives of that great body, the Miners' Association, and when you return to your constituents, you want to be able to say to them that you have carried out fully the good work that was presented to you, so far as you have ratified and confirmed the work of this Association during the past year. You have nominated our chairman, but it yet remains to elect the secretary, and I want to say to you, gentlemen, that from my own knowledge I know that Mr. W. C. Ralston, in the hour of need, has gone to the business men of San Francisco and the business men of this State. They have remembered his father; they have remembered what he did for the people of San Francisco, and the people of the State of California, and they have known that W. C. Ralston's judgment was right, and they have contributed with that liberality characteristic of the people of San Francisco and of the State of California. Gentlemen, we wish to carry out what we have early commenced—let us re-elect our old secretary. I have the pleasure, the honor, the privilege of placing in nomination Mr. W. C. Ralston.

JUDGE BELCHER: Mr. Chairman, I rise with great pleasure to second the nomination of Mr. Ralston for secretary of this Association. When we commenced our labors, and when it was necessary for the interests of the miners of this State that there should be erected a body of this nature, you and Mr. Ralston were of the first chosen to the respective offices which you now fill. It was, and at all times has been, necessary that there should be keen vigilance, that there should be a continuance of the indefatigable labor in behalf of the Association for the purpose it has in view to accomplish. Mr. Ralston has been all that we could possibly desire; he has been more than that—he has rare executive ability. He is not only acquainted with all the history of our Association so far as the work and the correspondence go to make it up, but with the old traditions that go along hand in hand with the daily and yearly life of the Association. We must grow and not stand still. This is a body of conservative men. This is in no wise a political institution. There should be no change of officers except for cause. There are no spoils to the victors here; there is every reason why those who have been to us worthy should be continued in their places. Therefore, I take great pleasure in asking, and desire that this nomination shall meet with the approval of this whole convention, and I second the nomination of Mr. W. C. Ralston for secretary.

MR. SHERWOOD (of Marysville): Mr. President, on this occasion, I have an apology to make to the gentleman that you propose to re-elect. I want to say that we have had trouble, we have seen tears shed on the one side, and we have seen hard times on the other side. I have always been straightforward on one proposition. As the editor of a newspaper, I have said things that I would not say personally. I have said of the gentleman that he was a "kid-gloved miner." Now, that may not be appropriate in ordinary business, but with an argument that you are making while you are editing a paper in the valley, it is good logic. But since then I have met him, I have become acquainted with him, and I want to say to you, gentlemen, that I do not believe it is so; I will take it back, and I will endorse his nomination.

C. W. TOZER (of Nevada): Mr. Chairman, I rise to second the nomination of Mr. W. C. Ralston for secretary of our Association. I have not in the remotest degree a personal acquaintance with the gentleman, and I only know of him two things, both of which are self-evident and obvious. The one—he is the son of his father, whom I did know; the other self-evident and obvious proposition is this—he has since the very inception of this organization, with zeal and with ability, faithfully performed the duties of secretary of this organization. Therefore, sir, I again say, I second the nomination of my friend, W. C. Ralston's eldest son.

The nominations were then closed and Mr. Ralston was unanimously elected by acclamation.

THE CHAIRMAN: Mr. Ralston, it affords me great pleasure, sir, having served with you for three years, to bear testimony to the indefatigable purpose of your labors. You have been re-elected by this Association as secretary for the ensuing year. Three cheers were then given for Mr. Ralston, and there were calls for a speech.

MR. RALSTON: Mr. Chairman and Gentlemen of the Convention: Some of my friends of Placer are calling for me to make a speech; they know I cannot make one, and that is the reason they have called for it. I wish to thank you, gentlemen, for the honor you have bestowed upon me by re-electing me secretary of this Association. I consider it one of the greatest honors ever bestowed upon me to have been elected the first time, and with the repeated elections I have more and more felt the honor. I have done my duty. I have done the best I could. I thank the gentleman, Mr. Searles, who so kindly placed me in nomination, and the gentlemen who seconded it. If it gives me a little too high opinion of myself, I will try not to have any trouble by getting the big head as some young men do. But I wish to thank you, gentlemen, and say that any young man who is elected secretary of the California Miners' Association, an association of men who have made the State of California what she is, and to which every one is turning now to help out of her destitute condition, ought to feel proud. I consider it the greatest honor that could be bestowed. Gentlemen, I thank you.

THE CHAIRMAN: The next business in order will be the election of vice-president.

JUDGE BELCHER: Mr. Chairman, in the line of the conservative sentiments that have been expressed here, and which undoubtedly we must treasure and keep if we must preserve our integrity as an association, and be to the State of California that advantage towards better days that we hope to be, I have pleasure in placing in nomination Mr. Samuel K. Thornton for vice-president of this Association for the ensuing year.

JUDGE SEARLES: I regret, sir, that I have overlooked one thing—the Searles family seem to be the great North American nominators. And it only proves how easy it is to do things if you only have discernment enough to float with the stream. Now, I have another son who is not here, and had I thought of it, I would have had him here to nominate Mr. Thornton, but he being absent, I rise to second the nomination of that excellent and capable gentleman.

The nominations were then closed, and Mr. Thornton was unanimously elected by acclamation.

Julian Sonntag and W. W. Montague were nominated for treasurer, and Mr. Sonntag, the present incumbent, was re-elected.

(*To be Continued in our Next Issue.*)

Resolutions Adopted by the Convention.

The following report of the Committee on Resolutions was unanimously adopted:

WHEREAS, The settlement of the State of California by Americans was brought about through the discovery of gold within its borders, and for many years the paramount industry was gold mining, which built up and enriched the many cities and communities then founded, it seems eminently proper that the people of this State, through their representatives in Congress, should aid in the resuscitation of this important industry, now suffering under unjust rulings and decisions of the Government departments and by the gradual encroachments of those not miners upon its mineral domain; therefore be it

Resolved, That our Senators and Representatives in Congress are hereby urged and requested to give their best efforts to aid the California Miners' Association in the passage of such mining bills or amendments as may be indorsed by the annual

convention of said association and presented for the consideration of Congress.

Resolved, That we recommend the re-enactment of the law passed at the last session of the Legislature, entitled "The California State Debris Commission, which appropriated the sum of $250,000, to be available when the General Government appropriated a like amount, for the purpose of the building of restraining dams, under the direction of United States engineers.

Resolved, That as the State Mining Bureau is the only State commission maintained in the direct interest of the miners of California, its scope should be broadened, rather than curtailed, to keep pace with the increasing mineral development. The published reports of the bureau serve to advertise to the world the mines and mining interests of California and bring into public notice the condition of all branches of one of our chief industries, thereby inducing examination and investment by capital. We hereby affirm our confidence in this institution and urge the necessity of its proper maintenance on such scale and by the employment of such technical skill as will permit it to still further advance the mining interests of the State.

WHEREAS, We recognize that our present greatness is due to the mining industries of the West, and we believe that our future prosperity depends upon the rehabilitation of gold and silver mining, and recognize the paramount importance of these allied industries as a factor in Western civilization and prosperity; and

WHEREAS, History bears us out in the statement that the demonetization of silver in 1873 resulted in an era of falling prices, in the increasing of the burden of debts, in the enrichment of the creditor classes; and believing that there can be no permanent return of prosperity unless silver shall be restored to its true position as a money metal, he it

Resolved, That the California Miners' Association declares itself in favor of the free coinage of silver at the ratio of 16 to 1, independent of any other nation, and to this end requests our delegation in Congress to further all legislation tending to the restoration of silver to its place as a money metal of the world, believing that such legislation would he for the best interests of our common country, and would meet with the unanimous indorsement of our people.

Resolved, That with gratitude we acknowledge the valuable assistance rendered to this association by the Board of Trade of San Francisco, through its strong and liberal financial and moral support, which has largely advanced the mining industry of this State.

Resolved, That the miners of California gratefully acknowledge the assistance they have received from the press of this city and of the interior in their efforts to place their industry on a more satisfactory basis. Without this assistance it is impossible for the miners to plead their cause before the public and obtain that popular recognition which will insure favorable consideration before the Legislature and Congress.

WHEREAS, There are extensive tracts of unoccupied mineral lands in the mining States and Territories, in order to develop which roads or trails must he built by the miner, thus entailing upon the individual miners an expense which the Government should hear, as it obtains the benefit from the sale of said mineral lands; therefore he it

Resolved, That Congress is requested to appropriate for each of the well-known mining States and Territories the sum of $50,000, said sum to be expended under the direction of the Governors and Surveyor-Generals of each State or Territory, or such other official as may be designated, for the purpose of building trails and roads to open and develop the mineral lands for sale by the Government; and the Senators and Representatives of the mining States and Territories are earnestly requested to secure this appropriation.

Resolved, That it is the sense of this convention that immediate action he taken to stop the issuance of patents to the Central Pacific railroad on pending selections awaiting the approval of the Department of the Interior for lands in the mineral section of California. It is further resolved that the Secretary of the Interior be requested hy telegraph to delay action thereon until a hearing is had on the subject. It is further resolved that a special committee of five members he appointed to take the necessary steps to secure such hearing and present the necessary facts and information to secure the rights of mining locators on land within the Central Pacific Railroad grant.

Resolved, That for the purpose of developing the immense mineral resources of northern California, consisting of iron, silver, copper, gold and other valuable minerals, we urge that additional national aid he extended toward the improvement of the Sacramento river as far as the city of Redding (the head of navigation), so as to furnish cheap and permanent transportation to markets demanding such products.

The following resolution commending the work of the Debris Commission was adopted on motion of J. M. Fulweiler of Placer:

WHEREAS, Under the several acts of Congress, relating to the rehabilitation of hydraulic mining, those eminent civil engineers, Colonel G. H. Mendell, Lieutenant-Colonel W. H. H. Benyaurd and Major W. H. Heuer, were appointed and have been the acting California Debris Commission and have made a report of their acts and proceedings under said laws of the United States, which is now before this convention; therefore he it

Resolved, That the said Commission has the entire indorsement and support of this convention. That we commend the various acts and decisions of said Commission and heartily indorse their recommendations as to the future of the mining industry of the country. That the hearty co-operation of the Hon. J. F. Kidder, State Debris Commissioner, in the efforts of the Congressional Commission to bring about the rehabilitation of hydraulic mining, meets with the approhation, and the thanks of this convention are hereby tendered to said Commissioners for the able, fearless and efficient manner in which they have each and all of them discharged their duties and made the prospect of good times, plenty of work and plenty of money possible to the mining sections of this country and through them to the commerce, the industries and revenues of our nation, and bringing once again prosperity, hope and happiness to the home and fireside of every miner.

Report of the Legislative Committee.

The Legislative Committee of the convention, which had the most important labors to perform, presented the following report, which was adopted:

To the President, Officers and Members of the California Miners Association—GENTLEMEN: Your Committee on Legislation beg me to report as follows:

We recommend the following changes in the Revised Statutes of the United States, relating to mining:

Amend section 2324 so that the same shall read as follows:

"Section 2324. Miners of each mining district may make regulations not in conflict with the laws of the United States or with the laws of the State or Territory in which it is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must he distinctly marked on the ground so that its boundaries can he readily traced, such marking to include one post or monument at each corner of the claim. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location and such description of the claim or claims located by reference to some natural or permanent monument as will identify the claim. On each claim located, and until payment of the purchase money and a certificate of entry has been issued therefor, not less than $100 worth of labor shall he performed, or improvements made during each year.

"Where such claims are held in common such expenditure may be made upon any one claim by any work or improvements tending to develop any such claims. The periods within which the work required to be done annually on mineral claims shall commence at 12 o'clock meridian on the first day of January succeeding the day of location of such claim. When the labor required hy this act shall have been performed or the improvements made an affidavit may be filed within thirty days after the time limited for the performance of such labor or making of such improvements with the Recorder of Deeds in the county in which the claim or mine is situated, particularly describing the labor performed and the improvements made, and the plat thereof and affidavit shall he prima facie evidence of the facts therein stated; and upon a failure to comply with the conditions of this act, in the performance of labor or the making of improvements, the claim or mine upon which such failure occurred shall he open to relocation in the same manner as if no location had ever been made; provided that the original locators, their heirs, assigns or legal representatives do not record work upon the claim after such failure and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditure required hereby the co-owners who have performed the labor or made the improvement may, at the expiration of the year, give such deniquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days, and if at the expiration of ninety days after such notice in writing, or hy publication, such delinquent shall fail or refuse to contribute his portion of the expenditure required in this connection his interest in the claim shall become the property of his co-owners who have made the required expenditure. The copy of such notice, together with an affidavit showing personal service or publication, as the case may he, of such notice, when filed and recorded with the Recorder of Deeds in the county in which such mining claim is situated, shall be prima facie evidence of the acquisition of such co-owners. Where a person or company has run or may run a tunnel, or constructed roads or trails for the purpose of developing a claim or claims owned by said person or company, the money so expended in running said tunnel or constructing said roads or trails shall he taken and considered as expended on said claim or claims; provided, further, that said claim or claims shall he distinctly marked on the surveys as provided in this act."

We further recommend that section 2324 of the Revised Statutes or the United States he amended hy adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

We further recommend that section 2335 he amended so as to read as follows:

"Section 2335. All affidavits required to he made in this chapter may he verified before any officer authorized to administer oaths in the State or Territory where the claims may he situated, having an official seal, and all testimony and proofs may he taken before any such officer, and when duly certified by the officer taking the same, attested by his seal of office, shall have the same force and effect as if taken before the Registrar and Receiver of the Land Office. Whenever any contest shall arise as to the mineral character of any land claimed to he subject to entry or sale under an act of Congress, it shall be the duty of the Registrar of the Land Office in which such contest is made, to immediately certify such contest to a court of competent jurisdiction in the county where such land is situated, and to immediately notify the contestants and contestee thereof. Within thirty days after such notice the contestant shall file in such office a verified statement of the facts upon which he hases his contests in plain and concise language, and shall serve the same upon the contestee, and thereafter and within the time provided hy the laws of the State or Territory where such land is situated, in answering any civil action, the contestee shall file his verified answer to such statement and thereupon the contest shall he tried and determined as are ordinary actions in such court, and when determined such determination shall he certified to the Registrar and such determination shall he hinding upon him and shall he forever conclusive as to the character of the land in question; provided that the presence of rock in place hearing gold, silver, cinnahar, petroleum or other valuable mineral shall he regarded as presumptive evidence that the land containing the same is mineral in character; and provided, further, that in investigating the character of land with a view to ascertaining whether it is more valuable for mineral than for agricultural purposes, evidences may he taken of the mineral discovered or developed adjacent to such land, proof of which may be taken as presumptive evidence that the land is mineral in character; and provided, further, that wherever land is proven to he within well-defined mineral helt, such land shall be deemed, presumed and taken to be mineral land, unless contrary is proven; and provided, further, that the provisions of this chapter shall he liberally construed, with a view to aid the applicant in procuring title to the mineral lands of the United States, and that the rules and regulations prescribed by the Land Department for its government and that of its officers, in disposing of said lands, shall he so formulated and administered as to assist the Government in disposing of said lands to bona fide applicants; and provided, further, that all applicants for patent for lands, other than mineral lands, upon which existed a valid mining location, the notice of which designating the section and township in which such location is situated shall have been recorded in the office of the Recorder of Deeds of the county wherein the land in question is situated must, except when otherwise in this act provided, give to such mineral claimant notice of such application in writing, or hy publication in the newspaper published nearest such mining location, at least once a week for sixty days."

We further recommend that section 2337 of the Revised Statutes of the United States he amended so as to read: "Section 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended to he used or occupied, hy the proprietor of such vein or lode claim for mining or mineral purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may he patented therewith or separately subject to the same preliminary requirements as to certificate or notices that are applicable to vein or lode claims, but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed hy this chapter for the superfices of the lode claim. The owner of a quartz mill or reduction works not owning a mine in connection therewith may also receive a patent for his mill-site as provided in this chapter."

In connection with the foregoing recommendations concerning the amendment of the Revised Statutes of the United States, your committee would further suggest that such changes be effected hy an amendment of the so-called Stewart mining bill which recently passed the United States Senate and is now pending in the lower house of Congress. Your committee recommends that all changes in the Revised Statutes other than those above suggested he opposed hy this association.

Your committee would also state that it has carefully examined into and deliberated upon the provisions of House bill No. 3476, introduced in the Fifty-third Congress hy the States of Montana and Idaho, with reference to the classification and selection of mineral lands lying within the grant to the Northern Pacific Railroad Company, within said several States, defining what shall be classed and taken to he mineral land, and providing for the procedure to he adopted by the Land Department, whether the report of the Commissioners provided for in such act as to such selection are contested or otherwise, and your committee respectfully recommends that the representatives in Congress from the several mining States he requested hy this convention to give the bill their hearty support.

Your committee would also suggest an amendment to the Code of Civil Procedure of this State to the effect that in all civil actions in the courts of this State, where a temporary injunction is issued at the time of filing the complaint, such injunction shall be dissolved at the expiration of one year from the date of service thereof unless the parties to the action consent to it continuing in force for a longer time, or unless the action he set for a hearing upon its merits.

Your committee would further recommend that the following act be presented to Congress and its passage urged:

"An act appropriating money for the construction of works to impound mining debris, and thereby to protect the navigable streams of California.

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

"Section 1. That there is hereby appropriated out of any money in the treasury not otherwise appropriated the sum of one million and thirty thousand dollars, which sum shall he immediately available and shall be expended under the direction of the Secretary of War, in accordance with the plans, specifications and recommendations of the California Debris Commission, appointed under the act of Congress entitled 'An act to create the California Debris Commission and regulate hydraulic mining in the State of California,' approved March 1, 1893, for the purpose of constructing works for the restraining and impounding of mining debris upon the tributaries of the Sacramento and San Joaquin rivers in California and the branches of such tributaries.

"Sec. 2. Whenever any such works for the restraining and impounding of mining debris shall have been constructed out of such appropriation, or shall have reached such a stage as, in the opinion of such commission, it shall he safe to use the same, it shall he lawful for such commission to make the order provided for in section 13 of said act, upon proceedings being first had and taken in accordance with the provisions of sections 9, 11 and 12 of said act, but in such cases the owners of the mines affected hy said orders shall not he bound hy the proviso to said section 13 of said act nor hy the provisions contained in section 16 thereof.

"Sec. 3. The said commission shall also have the power to make the order provided for in section 13 of said act as to any mine or mines whenever it shall appear to the satisfaction of said commission that no impounding works are necessary other than the means already provided hy nature to protect from material injury the navigable stream mentioned in said act and the land adjacent thereto, upon proceedings had in accordance with sections 9, 10 and 12 of said act."

Your committee further recommends that section 23 of an act entitled "An act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, he amended so as to read as follows:

"Section 2322. That any person or persons who willfully or maliciously injure, damage or destroy, or attempt to injure, damage or destroy, any dam or other works erected under the provisions of this act for restraining, impounding for settling purposes, or for use in connection therewith, shall he guilty of a misdemeanor, and on conviction thereof shall he fined not to exceed the sum of $500 or he imprisoned not to exceed five years, or hy both such fine and imprisonment, in the discretion of the court; and any person or persons, company or corporation, hy their agents or employes, who shall mine hy the hydraulic process, directly or indirectly injuring the navigable waters of the United States in violation of the provisions of this act, shall he guilty of a misdemeanor, and upon conviction thereof shall he punished hy a fine not exceeding $500."

All of which is respectfully submitted.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placere. history and development of mines, records of gold washing, mechanical appliancee, such as nozzles, hurdy-gurdye, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Concentrates.

JAMES BURKE is reopening the New York Consolidated between the Kate Hayes and W. Y. O. D. claims, Nevada Co.

THE Golden Star Mining Co. of Montana, a wild cat scheme with headquarters at Chicago, is trying to foist its stock. The concern is a good thing to decline.

A. MCFADDEN of the Yankee Fork mine, near Challis, Idaho, is about to put a fifteen-stamp mill on the mine. It will be a wet crusher, six vanners, electric light, etc. The mine shows much ore.

THE Weiser, Idaho, *Signal* says the Little Giant mine at Warreus has netted Geo. Reibold $50,000 this season. Reibold took hold of the mine and every one laughed at him. He can now laugh at the other fellows.

ON Dec. 8th the property of the R. H. Campbell Gold M. Co. at Quartz Valley, Siskiyou Co., will be sold at sheriff's sale on a judgment in favor of Herbert Kraft for $6190 and costs. It includes mining land, personal property, machinery, tools, etc.

ARTICLES of incorporation of the Anita Gold Mining Co. have been filed in Amador Co. by F. Reichling of Oakland, D. E. Hays of Mill Valley, John Barton of Alameda, George Goodman of Oakland and W. E. Davis of San Francisco. The company is capitalized at $10,000,000.

AT the Golden Feather, near Oroville, the completion of the new foot dam and the removal of the elevator will be deferred, the remainder of this season being devoted to putting things in proper shape for the winter. Col. McLaughlin expects to work the bed of the Feather next year.

THE Colorado Iron Works asks for a receiver for the International Nickel Mining Co. on behalf of all creditors. The complainant is a judgment creditor holding claims of $4629 and $3211. The capital stock of the defendant is $5,000,000, but it is claimed the property owned by it never exceeded in value $100,000. The scheme was floated by Gillette and Taylor, of Chicago, who bought a claim covering 260 acres in Douglas county, Or., from Selah Reeves for $51,000.

IN El Dorado county the Grand Victory is being again extensively developed; a ten-stamp mill is running on the Gentle Annie and a twenty-stamp mill on the Big Canyon. The owners of the Shaw mine are about to put in a one-hundred stamp mill, and a twenty-stamp mill is to be put on the Havilah.

THE *Record* says that financial difficulties involving Mr. Blake have brought an end to the railroad and consolidation scheme between the Pioche Con. Co. and the Nevada Southern Railroad. The railroad and other property owned by Mr. Blake are heavily in debt. Legal proceedings have been instituted and the properties are under attachment.

OFFICIAL NOTICES of three new and important laws relating to the public lands have been received. The first gives one additional year of grace for settlers on homesteads and desert lands who cannot make final proof this year. The second suspends for 1894 the requirement that settlers on desert lands shall spend $1 per acre for reclamation. The third increases the value of soldiers' additional homestead certificates.

THE usual sad results have followed the rush of miners to the placers of the Yukon river in Alaska last spring, says the Butte *Inter-Mountain*. Many miners from Butte, but scantily prepared for the rigors of a winter in that far northern latitude, participated in the stampede. Recent reports are to the effect that a few of them have done well and have something to show for their season's work, but many have been left stranded in that inhospitable region, and a few are "beating" their way back to "God's country" with the fixed resolve never to be caught in another stampede.

THE residents along Snake river were recently surprised to see a raft coming down the stream, having on board two men and a horse. On nearer approach the load was recognized as a prospector's outfit, with camp utensils and all the other paraphernalia of a prospector's life. The raft was a large one for the purpose, being 20x30 feet. It was a great scheme for getting out of the mountains, says the Lewiston *Teller*. They can run the raft below and work up the logs into wood, besides the transportation beats roughing it over the mountain trails.

THE Washoe Copper Company has incorporated at Butte, Montana. The incorporators are Charles F. Booth, Jobu Gillie, D. M. Newbro, Joseph A. Lewis and Oscar K. Lewis. The capital stock of the company is $5,000,000, divided into 50,000 shares of $100 each. The company is formed for the purpose of carrying on mining, smelting, etc., and the trustees are C. F. Booth, John Gillie, D. M. Newbro, J. A. Lewis and O. K. Lewis. The principal office of the company will be in Butte. This is the company which is now developing the Gold Hill properties.

AT Provo, Utah, the defense in the case of Phillip Cook vs. the Bullion-Beck & Champion Mining Company, wherein plaintiff sued for $15,000 damages, was to the effect that the stope wherein the accident occurred was abandoned, and no one was expected to walk over the plank that broke. Furthermore, plaintiff was a timberman, and was paid extra for his hazardous position. He should have investigated the soundness of the timber and used due caution. Judge Smith, after the arguments by counsel, instructed the jury that it was necessary for all to agree on the verdict. The jury gave plaintiff $3000. Thirty days' stay of execution was granted to allow defendant to prepare a motion for a new trial.

THE California Debris Commission has issued permits to the Volcano Gold Mining Company and the Chiua Hill mine, Amador county, to operate by the hydraulic process. The most important application yet made to the Commission has been filed by the Gold Run Ditch and Mining Company, which owns the Gold Run mine at Dutch Flat, Placer county. This company proposes to construct two debris dams in the North Fork of the American river. The estimated storage capacity to be created is 12,000,000 cubic yards. The plan calls for rock dams of "dry masonry." This means rocks placed and fitted by hand, without the use of cement, mortar or other binding material.

Cheap Reduction of Refractory Ores.

—IN OUR—

Oxyhydrogen Quick Fire Process

For the cheap reduction of refractory ores, we first crush and pulverize the ore as it comes from the mine, without the use of water, to about forty mesh; then feed it into our

Oxyhydrogen Blowpipe Furnaces,

Where, with the use of compressed air forced through the blowpipes, the ore is kept in a constant whirl through the 100 feet of furnace construction, enveloped all the time in OXYHYDROGEN FLAMES, which completely roasts or deoxidizes it in the few minutes it takes to pass through.

SPECIAL FLUXES ARE USED,

Which hold most of the values that are in a volatile form until they are reduced to a metallic. The ore passes from the furnaces into the ore tank, while the vapors or volatile matter, being under pressure, passes over into the next tank, where it is deposited in a PREPARED LIQUID, which retains all remaining values. The ores containing the precious metals are passed from the ore tank into our

"Amalgamating Mill,"

Where the gold and silver are extracted. The gangue or pulp is from thence passed on to the

PATENT CORRUGATED WOOLEN-WEB CONCENTRATOR,

Where the "Flour Quick" and any remaining particles of metal are caught and saved. In operating these furnaces the oxygen and hydrogen gas burned makes a saving of about one-half the fuel. Therefore, in operating furnaces that will treat fifty tons of ore per day the consumption of wood is only about three cords. By this rapid process gold and silver base ores can, at the mine, be worked from the dump to base bullion for from $1.50 to $3.00 per ton, according to size of plant (providing wood is not over $3.50 per cord and water plenty), and the result will show a saving of ninety to ninety-five per cent of the fire assay.

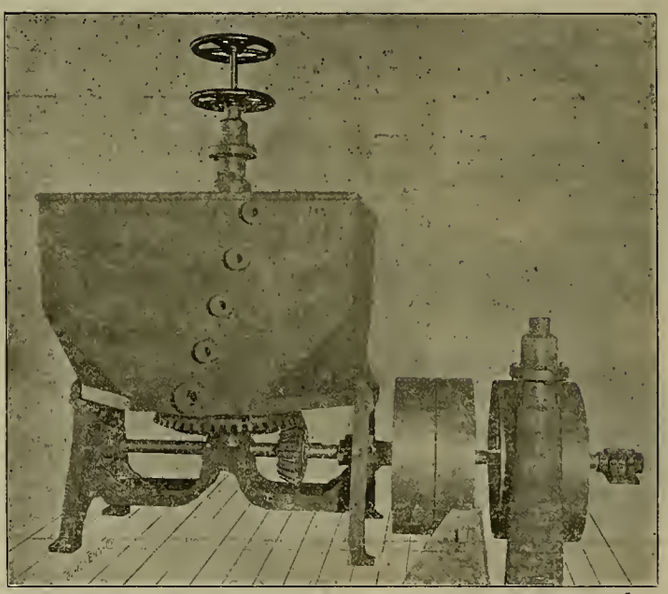
The owners of this process have reduction works here, for making **small or large WORKING Tests.**

They desire to erect complete plants of their own patent machinery on mines, at expense of the owners, to work from ten to fifty tons per day, and receive a small royalty therefrom during the life of their patents. Many samples of base ores can be seen at office, also the working tests made.

HOLLAND & ROBINSON,

OFFICE.....170 CROCKER BUILDING

Amalgamator and Settler.



The above cut represents a combined Pan and Settler for the purpose of working Mill Tailings, Concentrates, Sulphurets, Tellurides, and refractory Gold and Silver Ores, by the Steam Pan Process, or by Roasting and Amalgamation.

Will handle Gold Bearing Beach Sands the best of any mining machinery now in use.

It is designed for grinding and amalgamating the ore by a rapid movement of the Shoes and Muller, then change the speed to a slow movement of the same, and let in water to settle and flow out at the upper plug openings at first, and so on till all the pulp has left the pan, and the gold and silver with the quicksilver remains in the bottom of the pan to be taken out at pleasure, or after a large amount of ore has been worked.

These pans are manufactured of good material, in the best workmanlike manner, and warranted to do the work for which they are designed. They work by charge. Capacity, one and one-half tons. Weight of machine complete, four thousand five hundred pounds.

Small Laboratory Pans of fifty pounds capacity are also provided of the same pattern as the large size, for the purpose of trial tests, which are kept in constant practical use at the sampling works, **10 Stevenson street, San Francisco, Cal.**, to determine what process is required in handling different ores.

Mining Property Examined, Analysis of Ores, Plans, Specifications, Estimates of Cost, and information as to the most profitable way of opening up and developing mines and milling ores.

Notice of Assessment.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of October, 1894, an assessment, No. 1, of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 56, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of December, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, 309 Montgomery St., Room 56, San Francisco, California.

Notice of Assessment.

NOTICE OF ASSESSMENT.—OCCIDENTAL CONsolidated Mining Company; location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey Co., Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the first day of November, 1894, an assessment, No. 17, of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth day of December, 1894, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

VALUABLE MINING PROPERTY FOR SALE.

A ditch carrying 150 miner's inches of water and ten miles long, through some rich gold placer claims unworked. Three mining claims—gold—with pipes and giant and sluice boxes, all complete for working, will be sold

At Public Auction, on Saturday, Dec. 8, 1894,

On the estate of the late ELLIOTT McKINSTRY, on the banks of the Middle Fork of the American river, 1¼ miles east of Auburn, Placer county, Cal., at 1 o'clock, P. M.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from E. P. Hagar & Samuel Peck in the U. S. Grant Mine, near Blue Tent, Nevada Co., Cal., to impound tailings behind brush dam in ravine below the mine; from John Black in the Spanish John Mine, near Rough & Ready, Nevada Co., Cal., to impound tailings behind brush dams in blind ravines and pit; from the Good Hope Mining Co., in the Richmond Hill Mine, near La Porte, Plumas Co., Cal., to impound tailings behind log and crib dam in Onion Valley Creek; from Leonard Dormody in the Martelle Mine, near Salmon Falls, El Dorado Co., Cal., to impound tailings behind dams in Martelle Creek; from J. M. Read & N. E. Beckwith in the Pine Grove and Hidden Treasure Mines, near Pine Grove, Amador Co., Cal., to impound tailings behind brush dams in Saw Mill Gulch and behind log and rock dam in Grass Valley Creek; and from the Gold Run Ditch & Mining Co., in the Gold Run Mine, near Dutch Flat, Placer Co., Cal., to impound tailings behind a rock filled dry masonry dam, 100 feet high, in the North Fork of the American River, about 2 miles above its junction with the Middle Fork, gives notice that a meeting will be held at Room No. 62, Flood Building, San Francisco, Cal., on Nov. 26, 1894, at 1:30 P. M.

FRUE ORE CONCENTRATOR,
132 MARKET ST.,
San Francisco, Cal.

GLADSTONE MINING COMPANY, C. J. Clark, M. E., Gen'l, Supt. FRENCH GULCH, Shasta Co., Cal., Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill. C. J. CLARK, Gen'l Supt.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

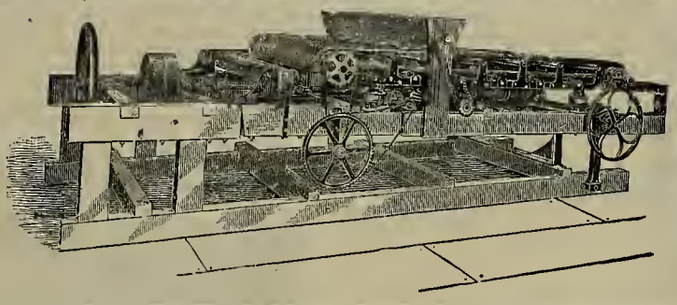
NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

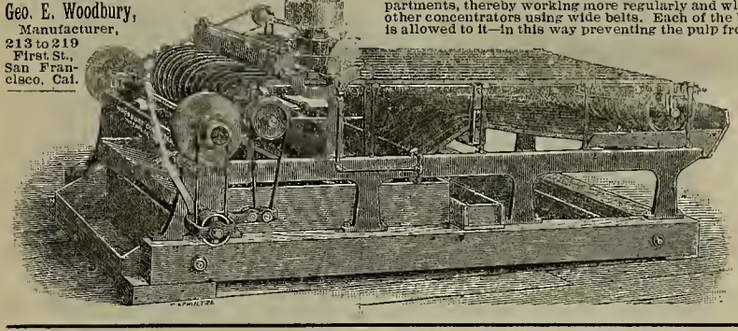
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891, MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. Price $575 f. o. b. Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
213 to 219 First St.,
San Francisco, Cal.



PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1894

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 22. SAN FRANCISCO, SATURDAY, DECEMBER 1, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Debris Commission.

Unusual interest was attacbed to last Monday's meeting of the California Dehris Commission, the application of the Gold Run Company for permission to operate its hydraulic mine being made the occasion of a bitter attack on the company hy the attorney of the Anti-Dehris Association. The application is the most important read since the organization of the Commission, dams of more than ordinary magnitude being required and considerable opposition being manifested to the granting of the permit. The company ask to be allowed to huild a rock fill dam 100 feet high; 240 feet below the center of tbe main dam it is proposed to place a small dam of similar character in order to form the cusbion pool at tbe hase of the main dam. The material proposed to be used heing the trap-rock forming the sides of tbe canyon, to he quarried out on eitber bank on a level with the top of the dam in order to increase tbe width of the spill, the sluice to be six feet wide, two feet deep, with a grade of six inches in twelve feet. Amount of material to he worked per hour, 100 cuhic yards.

The material is estimated to consist of nine per cent boulders, thirty per cent cobhle stones, fifty per cent gravel, ten per cent sand, one per cent loam or pipe clay.

The area to he worked is that part of the claims enumerated, situated in the cbannel of the Blue Lead, consisting of ninety-four acres. The channel is ahout 400 feet average widtb, probahly 100 feet at tbe hottom, and the depth about 125 feet.

The survey for tbe reservoir was carefully made, but was not carried heyond 16,800 feet above the dam. The capacity to tbat point is ahout 12,000,000 cuhic yards. A reservoir formed by the dam would be equal to 12,000,000 cubic yards.

There being hut one per cent of clay is accounted for by the top dirt having been previously washed off in operating the mine.

The Commission discussed the matter at length and took it under advisement.

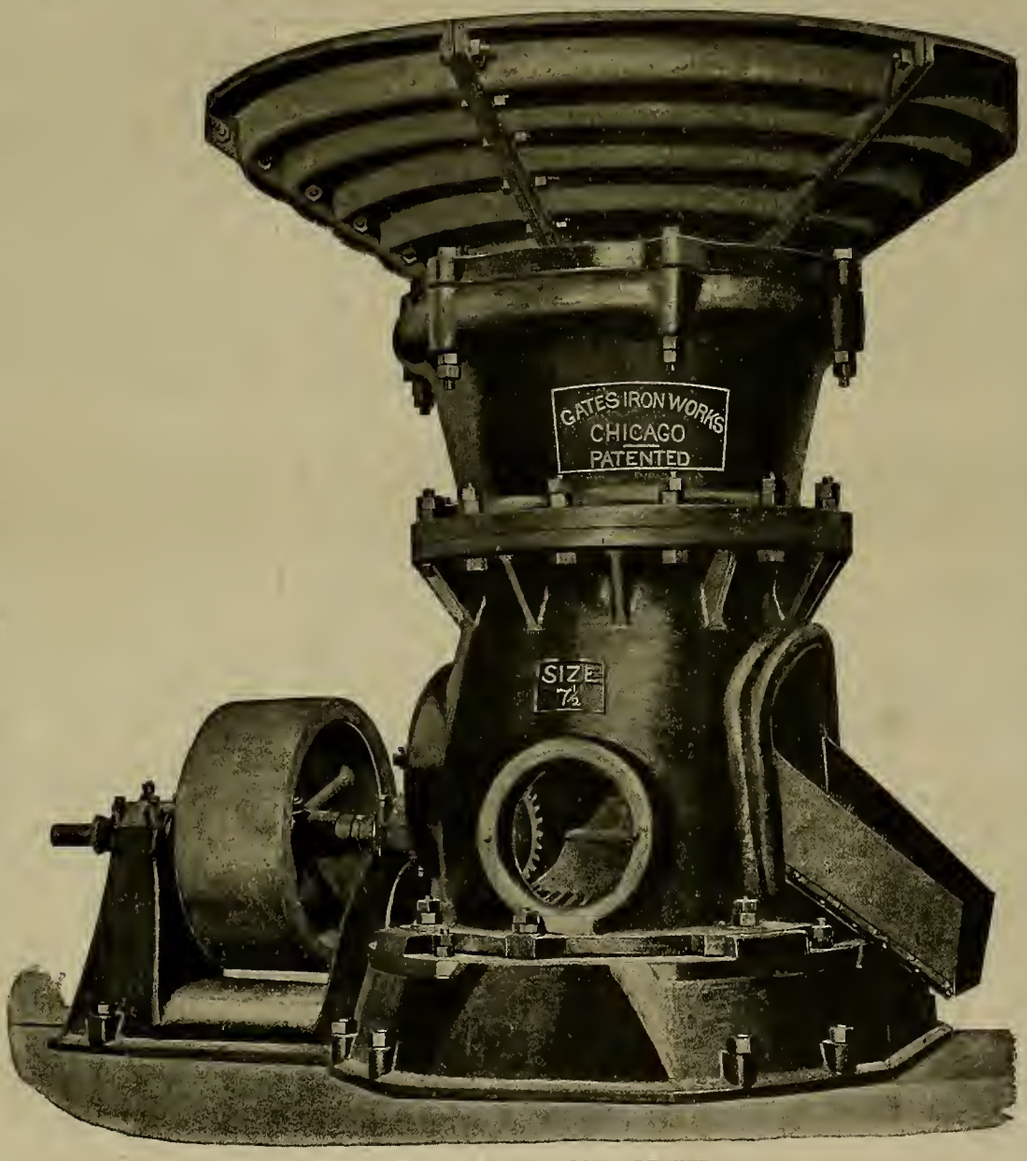
The following permits were granted: To E. P. Hager and Samuel Peck, to erect three brush dams six feet high at the U. S. Grant mine, near Blue Tent, Nevada county; to Johu Black, to ercct two brush dams six feet high at the Spanish John mine, near Rougb and Ready, Nevada county; to tbe Good Hope Mining Company, a log and crih dam forty feet high and forty feet wide at the hottom at the Richmond Hill mine, near La Porte, Plumas county; to J. M. Read and N. E. Beckwith, log and crib dam fifteen feet high at the Hidden Treasure mine, near Pine Grove, Amador county, and a hrush and stoue dam fifteen feet high at tbe Pine Grove mine.

ALLEGED "patent lawyers" in Londou have heen so actively swindling Americans tbat U. S. Minister Bayard bas warned inventors in this country to be wary in dealing witb Londoners who profess ability to secure Englisb patents.

EVERYTHING augurs well for a renewed interest in Califoruia mining operations during the coming year.

The Gates Ore and Rock Crusher.

Herewith is illustrated an improved form of tbe Gates crusher which for many years has held prominent place in machinery of this character not only in tbis country hut abroad, and may be considered as representative of the best type of construction yet devised for machinery of this character.



THE GATES ORE AND ROCK BREAKER.

The capacity of these machines ranges all the way from 2 to 150 tons per hour — that bere shown being one of the largest — capable of crusbing the hardest material at the rate of 150 tons per hour. This size machine is used principally in tbe large smelting and iron ore furnace plants of the East, as well as for macadam or road work. No other crusher, it may be said, bas ever heen found to stand the severe strain to whicb tbcy are subjected in handling tougb iron ore and bard blue tap rock. The sizes most commonly in use on this coast range in capacity from 1 to 20 and 30 tons per hour. The advantages claimed for these crushers are great economy in power as well as fineness and uniformity of product, its capacity for fine work being a consideration of importance in quartz mill work.

The rougber work being done by the breaker, saves the wear of the mill, whicb is hy far the most expensive part of the equipmeut, while the increased fineness adds to the output of a mill without auy corresponding increase in cost. Most of the sizes will produce a product fine enougb to pass through a one-half or five-eigbtbs inch ring, while a considerahle part will be fine enougb to pass a 15 or 20-mesh screeu.

The Treadwell mill, in Alaska, bas recently installed two of these machines, having a capacity of 1000 tons per day.

The Pelton Water Wheel Co., 121 Main St., this city, are tbe general agents for the Pacific coast.

THE work of the convention is by no means over, though tbe session bas ended. The Exccutive Committee of the California Miners' Association must now carry out the conclusions of the convention.

THE gold mines of tbis State have probably increased tbeir product from two to three million dollars over last year's output.

As soon as the water season commences some of the hydraulic mines which have built impounding works this year will commence operations under the new conditions. Most of them are confident of success.

"MACHINERY" aptly says:

"Write-ups" are the curse of trade journalism, for they never contain any news and seldom any information. They are mpositions on the good faith and good nature of the men who buy the paper for news, and they are tokens of dry rot wherever they appear. Beware of papers that are liberal with "write-ups." Space in them is of little value or it wouldn't be given away.

THE remarks of State Mineralogist J. J. Crawford on the mining statistics of California, made before tbe Miners' Convention, are omitted from the printed proceedings. Owing to the absence of Mr. Crawford from the city, we did not care to priut his speech until it could be revised by him. Prof. Christy's paper is also omitted, but will be published in a future number of the PRESS.

ONE RESULT of the recent Miners' Couveutiou has been to awakcn a reuewed interest among the people of this city and State; in the mining industry of Califoruia. They have been made to see that the mines are an important factor in our industrial advancement, aud that the miners should be encouraged in their efforts to rehabilitate their industry and increase the output of gold within our borders. Tbere is now a very different sentiment with regard to mining from what there was a few years since. It was at one time looked upon as a merely speculative sort of affair, but is now properly recognized as a legitimate busiuess for safe investment. Thc people of California will in the future do more for tbe miners than they have been doing.

WE devote most of our space this week to concluding the account of the proceedings of tbe State Miners' Convention. The speeches and papers have been given practically in full, with only one or two exceptions, so that those at a distance in the mining regions, who were unable to attend, by readiug this account may know what was said by those appearing before the convention. The results of this session were advantageous in many respects. The wants of the mining commuuity have been formulated and will be brought to the attention of Congress in due time. That body is slow to move in making changes affecting the great industries of the country, of which mining is one, yet energy and persistence on the part of petitioners who only want their just rights is bound to win in the end.

STATE MINERS' CONVENTION.

Proceedings of the Annual Meeting of the California Miners' Association.

(Continued from last issue.)

Congressmau A. Camiuetti was called upon to address the convention and said:

Mr. Chairman and Gentlemen of the Convention: I am pleased to have the opportunity to appear hefore you upon this occasion, not for the purpose of making any extended remarks or giving any suggestions or advice, but as au humble memher of the convention, for I hold a seat in this convention as a delegate from the county of Amador, and as your retiring memher of Congress from the Second District to make a sort of report of what has heen done upon the mining measures.

Before I start upon what I wish to say in that regard, I desire to say that, although your Committee on Resolutions has not yet reported, and your Committee on Legislation has not as yet filed its report, I was told, "How do you expect to say anything ahout the mining issue or about what is to be recommended hy this convention, when the reports of these two committees have not been presented?"

I want to say to the memhers of the Miners' Association assemhled here to-day that I have the utmost faith in whatever you do here on this occasion as heing hased upon justice, equity and right, and that there is no resolution, no action that the convention may see fit to take in its collective wisdom upon these questions that I do not support and uphold. It is not necessary that I shall see the report of your two committees upon that subject.

Now, hefore we go on: We have established landmarks of late years upon the mining question, and I know of no people upon God's footstool who have more appreciation and a higher sense of gratitude than the miners of this country, and it may he well to remember the starting point of all of this work. And to the convention which met in the city of San Jose in 1890 helongs the credit of having presented the first resolution in this State incorporated into a political platform, which came out manfully in favor of the rehahilitation of hydraulic mining in the State of California.

Now, in relation to the bill of 1892, I want it distinctly understood, and you will pardon me if I am a little personal in reference to an act that in some quarters of the State, wherever that hill has worked well, it has heen called the hill of somehody else, and wherever that hill has heen wrong and worked harm it has heen called my bill. Now, I want it distinctly understood hy the people of California that that bill as originally introduced hy me, with one solitary provision which was not mine, was my work, and that no living man ever saw it until I read it to the distinguished committee which you sent from your convention to the city of Washington. That provision was the three per cent tax. I had nothing to do with that and do not claim it, hut the balance as presented hy me is my own work. I am willing to assume the responsihility of its failure or whatever it may hring ahout in this State.

Now there have heen some other matters hrought hefore this convention, and at all times I have attempted to follow the request aud the resolutions which you have sent m to Washington for us to act upon. I believe I followed your wish when in the halls of Congress we hrought up the mining hill that you have before you to-day, as one of your laws. The penal clause was added to that—this is another thing I had nothing to do with—it is not mine. Those who desire further information upon that can get it hy looking at the record. That was not my provision. I was against the penal clause and fought against it to the last. And your own representative sent to Washington upon that subject, when he left there, authorized and I have his authority to accept the hill as amended hy the Senate. Hence, if you have any fault to find with the penal clause in that hill, do not hlame me. You will find some one else to blame. I followed the instructions of your committee in accepting that hill as we were compelled to accept it.

Another thing: You passed resolutions in favor of certain mining legislatiou; I did not introduce the whole of the hill as presented, hecause I feared that if you presented eight or ten long sections, that it would he almost impossihle to secure consideration. The material provision in those resolutious, however, that in relation to contests between miners and agriculturists, I did iutroduce, and upon that I desire to give you the history of the work that was accomplished in the last session of Congress.

I introduced hill 4402 upon the subject regarding the recommendatious made hy the convention. We went hefore the Committee on Mines and Mining. Here is the original hill I introduced to carry out identically the provisions recommended by this convention a year ago. I left out the balance for reasons already stated. Mr. Newlands introduced it in the House and Senator Stewart introduced the original Stewart bill in the Senate; that passed the Senate and is now pending in the House of Representatives hefore the Committee on Mines and Mining. After the committee organized, I appeared hefore them in relation to this measure. I found two or three gentlemen, members of the committee, who were from farming sections of the United States, and they said openly that I was trying to do something for the miners of California, as against the interest of the farmers of the State, aud they antagonized the measure in four or five sessions of the committee. Fiually I suggested, seeing we could not get harmony—Mr. Newlands was present at those sessions, aud will hear out what I say—finally I suggested that the hill be referred to the Secretary of the Interior for his recommendation, and that was adopted. I appeared hefore the Commissioner of the General Land Office upon the subject, and found after considerahle discussion that he was against the hill, and he made a report, which I have here, against all the provisions of the hill as adopted hy the Miners' Convention. It is too long for me to read at this time. I will leave a copy of it with the Association so they can see it. Here is the recommendation of the Commissioner of the Land Office, defeating entirely the wishes of the memhers of this convention, and the people of California, as I understand them to he. Finding the Commissioner decided against it, I then went to the Secretary of the Interior and asked permission to have a hearing hofore him or hefore any law officer of his department, in whom he had confidence. Finally, the Secretary of the Interior appointed one of his trusted counsellors and advisers to consult with me upon this question. I had three meetings with him, and finally I succeeded in getting from that Department a recommendatiou overruling everything that the Commissioner of the Land Office had done with relation to this hill.

I concurred generally with the views of the Commissioner, with the modification and amendments recommended in his report, hut I would suggest that the proviso in the nineteenth line, which is the part in relation to contests hetween miners and agriculturists, that the proviso in Section 9, page 5, nineteenth line, be amended to read, "Provided that the presence of rock in place, hearing gold, silver, cinnahar, or nther valaahle deposit of mineral, shall he regarded as prima facie evidence that the land adjoining the same is, and always has been, mineral in character, provided, further, that in investigating the character of land with a view to ascertaining whether it is more valuable for mineral or agricultural purposes, evidence may he taken of the mineral discovered or developed adjacent to such land, proof of which shall he presumptive evidence that the land in question is mineral in character; provided, further, that wherever land is in a well defined mineral helt, it shall he prima facie evidence that the land is mineral until the contrary is proven."

One object I had was found in this expression: "Bearing gold, silver, cinnahar or other valuable deposits of mineral."

The Commissioner of the Land Office laid stress upon the fact that the law we were seeking to embody into the Statute enahled any miner who might find some little mineral to get a patent to his land, and yet the claim might not he a valuable one. I could not succeed in convincing this officer that that part of the law should he overruled. But if you will take the law as passed hy the House of Representatives you will find that that is changed hy the House, and that the law reads, as passed hy the House: "In cases of contest as to mineral or agricultural character of land, the testimony and proofs may he taken under such regulations and notice as the Commissioner of the General Land Office may prescribe, provided that the presence of rock in place, or deposit bearing gold, silver, cinnahar, or other valuable mineral." It did not require it to he a valuahle deposit or a valuahle mine, hut that you have found upon it valuable mineral.

Now, regarding the quantity. That has heeu a great question. Those memhers of this convention who have practiced before the Department and hefore the Courts remember that the great stumhling hlock has heen in these contests hetween agricultural and mineral claimauts, and hetween the railroad in the Second District and the mineral claimants; that they always succeeded in overcoming the mineral claimants on the ground that they had not established the existence of a valuahle paying mine. If we can overcome that ruling hy law, and prescrihe in the law that it shall he the evidence of a claim having valuable mineral, we can settle the question in my judgment. If I am wrong I would like to he corrected hy those who have had more experience in these matters, hut from the stress laid upon that subject by the Commissioner, who dwells in five or six pages on this matter, upon that very question, wherein he says that if a miner finds five dollars worth of gold upon his claim he would he entitled to a present, I said, "If there is no gold at all, how can you tell that by prospecting the work he will not find a valuahle claim?" If a miner is willing to spend his time and money and pay douhle price for the land, why should he not he given an opportunity to develop a claim? I showed to the satisfaction of the Secretary of the Interior that the rulings of the Department, as they have ohtained for the last 10 or 12 years, would have lost a patent to a thousand valuahle mines in this State to-day. One of the best mines in the State—some people are here now, and I see one hefore me, interested in that mine who will hear me out—Mr. Reichling of the Kennedy mine. Under the rulings that the Commissioner wants to establish in this country; at the time that the Kennedy mine was patented, that mine never would have beeu patented, and yet to-day we are in Amador proud to say that we have one of the richest gold producers in the world. Such was the case with the Plymouth mine in our county, producing nearly $6,000,000 and never showed a speck of gold until they got down 1180 feet. In this experience I succeeded in overruling the Commissioner.

MR. SHERWOOD: Mr. Chairman, I have got to go home this evening, and I want to make a few remarks, if the gentleman will allow me to do it. I am told by the chairman of the convention, who has just left here, that a resolution has been introduced there endorsing the work of the Commission, provided for by the Caminetti bill. Am I right about that, Mr. Chairman?

THE CHAIRMAN: You are.

MR. SHERWOOD: Now, sir, I had intended—Mr. Caminetti, will you excuse me?

MR. CAMINETTI: Yes, with the utmost pleasure.

MR. SHERWOOD: I came here as the representative of Nevada county, because the gentlemen who appointed me to the Miners' Association of Butte county asked me, before I was appointed, if I would serve. I said, "Yes." There never was a time in my life when I have been able to talk that I would not express my opinion, and I am here for that purpose now. I had intended, as I said to Mr. Cross and to Mr. Caminetti to-day, to introduce the resolution endorsing the work of the United States Debris Commission provided for by the Caminetti law, and I want tbis conveution to endorse it—I do not waut to hear a voice raised against it. We of the valleys have got cranks among us; and you of tbe mountaius have cranks among you. But, sir, the couservative element there means exactly what that law means.

THE CHAIRMAN: Mr. Sherwood, the resolution introduced here, endorsing the action of the Debris Commissiou, did not take the course it was intended all resolutions should take, but I will, out of courtesy to that Commission, say that it was passed unanimously without reference.

MR. SHERWOOD: I supposed this convention would unanimously listen to me a few minutes, because Mr. Caminetti is willing. I do want to see that work endorsed; I want to see it going on because it is doing right. It is doing good to the miners, it is doing good to the farmers. It is saving us in the valley thousands and thousands of dollars that we have paid to lawyers. While the lawyers may be honest—and I have never seen a lawyer who was not honest—I believe like my frieud Mr. Fairchild, who stumped the State with Mr. Estee, that "we have got tired waiting." I believe tbe lawyers are generally good men, but like the orators that are hired to tell their story, they sometimes make a mistake, and as sure as you and I live, Judge Cadwalader and Judge Wallace—they are like twiu peas in a pod—meant well, but we got left, and you fellows got along all right. The North Bloomfield Company, after six years of litigation, were fined three times. Hayward's fees amounted to $2,750. Why, they stood and laughed. Wben we sent out spies up there—you fellows called them spies, we called them gentlemen—we said,

"Stand back and watch the monitors by the moonlight." They paid $2,750 in six years—it was a license to run a big mine and every small mine in the county of Nevada was shut down, because they could not afford to fight it in the courts. I want to see this convention endorse the work done by this Commission because I know it is right. The people of Marysville endorse it almost to a man.

MR. CAMINETTI: Mr. Chairman, I am glad to have the distinguished gentleman from Yuba county make the statement he has here to-day, for it shows that the miners and valley people are at least upon friendly terms and are willing to move on to a prosperous future. As I said just before Mr. Sherwood asked permission to speak, the Secretary of the Interior finally overruled the action of the Commissioner. Before acting upon it, however, being called to California upon matters of another nature, I attempted to see as many of the Executive Committee as possible. I believe I met in this city my friend Scarles of Nevada, who had proposed this proposition in the Executive Committee of the Miners' Association, and I submitted to him the action that was then agreed upon by the Committee, and he looked over the bill and thought that was the best we could do—that that would be satisfactory. He had been engaged in cases that this question had risen in and said that that would cure all of the defects, in view of the fact that the Supreme Court of the United States had enunciated and determined so freely as they had. On returning to Washington I went before the Committee again, and that Committee made a report, a copy of which I have here with me, recommending the passage of the bill as agreed upon by the Secretary of the Interior, changing, however, that expression that they desired, "Other valuable deposits of minerals," to the wording as found in the law, "Or other mineral," so as not to require the miner to prove that he had a valuable mine before he could get a patent on it.

That law was brought up in the Committee. The first time it was objected to under a misapprehension of the facts. Then it was called up again and passed without trouble. It is now pending before the Senate Committee on Mines and Mining, Senator Stewart being Chairman of the Committee at the time it went over to the Committee. The two Houses were engaged in the tariff discussion, and nothing was in order except the solution of that question. The Senator thought to attempt to pass that hill at that time might endanger its passing. He advised that we wait until the re-assembling of Congress in December; then, he said, we would call it up and have it passed. I will leave a copy of the bill as it passed the House, and the original copy, and I desire to have them look into the matter, and to make such suggestions as they deem proper to be made. I am endeavoring, as one of the delegates, to do my share as to carrying out the will and wish of this convention upon that matter.

There is another matter that I think this convention ought to take immediate steps upon; and it is important, for, after you pass this law, you do not win this fight unless you take other steps. The great trouble, as I have found by correspondence with people who reside in Placer and Nevada, and along the line of the Pacific railroad grant, is that today patents are being issued to the railroad for lands that actually are mineral and ought to be given to the miner. Unless you stop that work, you will lose the opportunity of getting the valuable mines that are now upon this land and have caused a great deal of trouble.

Before leaving Washington after the adjournment, I called upon the Secretary of the Interior and obtained from him the figures: The total amount of the Southern Pacific land grant in California was about 1,638,000 acres. Up to that date—June 30, 1894—491,000 acres were patented, and on the same date there were pending selections already approved by the officers, and only awaiting final decision of the Secretary to be patented by the President of the United States—414,500 acres—and the balance not as yet located and surveyed amounting to 732,000 acres. Now, while you people are waiting, while the people throughout the district are doing nothing, the Southern Pacific Railroad, by its army of officers, by its army of perjured witnesses, is going around the district and in the land offices in this State and in Washington robbing, from the people of this State and from the miners, the land that belongs to them. Now, you can do more good upon this question by appointing a committee to take such steps here in this convention as will stop the further issuance of these patents that are now awaiting the approval before the Secretary of the Interior. That is important work for you to do, and one-half of the battle can be won right there if you do but take hold in earnest and pursue the subject—414,000 acres in the mineral belt now by perjured testimony in half of the cases, I have no doubt, awaiting approval in order to be patented; and once patented, no matter what the rights of the miner may have been, it will be too late then to sue and pass resolutions denouncing this, that or the other.

Now is the time to act, and I hope that this convention, holding the interest of the miners of Nevada county, Placer county and the adjoining country at heart, will take immediate steps to call upon the Secretary of the Interior, by resolution sent to him by wire, to hold back his decision until the miners of this State can be heard before these final selections are patented. I am but one member of the delegation—an humble member—but I promise you here now, Mr. Chairman, as I have promised you in the past, to be with you in everything for the good of the miner. Whatever I can do upon that, you can command me at any time as long as I am a member of Congress. If you need me after that, why command me, too, and I want no fee for my services either as an attorney or for my expenses in going to and from Washington. Now, I hope that some gentlemen of the convention will move a resolution upon this subject, and that some action will be taken on the subject of these patents.

I am not finding fault with the Receiver of the Land Office at Marysville, because I know that he is bound down by rules and regulations that he cannot shirk. What I have said does not apply to the officers who are doing their duty, but it applies to the chief officer who wrote this opinion and has seen fit to write opinions for your guidance which you are compelled to follow as an officer. You must follow them, or, if you refuse to follow them, you will be compelled to step out of your office. I am complaining against the departmental law that has been enforced in Washington by some of the officials. This is one of them; and under this departmental made law, against the spirit of our laws, against the spirit of the mining laws, it has been intended to give to this corporation lands that do not belong to them—lands that by this decision of the Supreme Court of the United States is plainly said to belong to the people, and any attempt to wrest it from the people by the means that they have resorted to is illegal and a fraud.

If I can get a resolution passed, calling upon the Secretary of the Interior not to issue another patent until the facts are brought before him, I know we will get a reservation of many of these patents now awaiting approval. I have not the time to go through this decision in the case cited by Mr. Ricketts yesterday. The decision is an important one and makes plain our duty, and makes plain what the law is. It might have been declared that way years ago. New light is breaking and at last the people are coming into their old heritage. The corporations have been notified by the Supreme Court of the United States, not only in this decision, but in others, that they must stand upon equal footing with others in the community. This decision here written by Judge Field sets forth all these facts and makes our duty plain.

There are a number of questions I intended to touch upon, but I know if I keep you here long I will interfere with other duties, so I will bring my remarks to a close by making reference to one or two provisions of the Debris bill now in force. I think in the operations of that law, that we really have not given a fair chance to the Mining Debris Commission to put the hill to full test as yet. I am glad to see, according to the report in the newspapers yesterday, that at last we will have a practical test—where the seventeen hydraulic miners of gold have united in asking this Commission for permission to jointly build a dam. That is bringing the bill to a test. We have not really given the Commission an opportunity to say what they would do, or to see what the law would do by way of settling this great question. I hope there will be an opportunity given to you, gentlemen, to put the law to a test. They are able men. We all have confidence in their integrity and ability; and we but need to give them an opportunity to put the law to a test to see that the laws that we now have are really sufficient, with such suggestions as may be necessary by way of amendment, to bring us to a solution of this question upon the ground of entire fairness to all interests, and of entire protection to the valleys and to the rivers.

This is my proposition: You know that you have upon the Sacramento river thousands of acres of lands that are useless for any purpose except to raise mosquitoes and produce malaria. Now, then, it seems to me it would be an easy matter to get the consent of the owners of those lands for the purpose of using them to dump upon; it may be a useless task, but it is worth trying. I think if you were to appoint a committee for the purpose of investigating this question and seeing the owners of the American basin—

THE CHAIRMAN: If you will allow me to inform you, Mr. Caminetti: We have a State Commissioner of Public Works, who is investigating that matter thoroughly, and we are expecting an address from him at this convention.

MR. CAMINETTI: That would be one part of the work, and I am very glad to know that Mr. Rose, as a representative of that interest, believes that that is a practical idea, and that it can be successfully worked. That is what I have understood his views to be.

In conjunction with him, if you appoint a committee representing this Association to investigate this matter and consult with the owners of the American basin, where there are one hundred square miles submerged most of the time and fifty square miles submerged most of the year, and also other tracts in other sections of the Sacramento river, and then appear before the Mining Commission and ask them to establish the harbor lines, as provided by the law of 1886—why, it seems to me that you will solve an important question in the direction of enabling the rehabilitation of many of the mines that now cannot work in the San Joaquin river. There has been but little injury done by the working of these mines, and those of you who know the great amount of mining done in the southern mines, know there was a great deal of material that ran down from Calaveras, Tuolumne and other sections into the San Joaquin, and yet mining has done no injury to that river, because on the way down from the mine to the river this material did not go down by an open channel, as in the Yuba, Bear and American rivers, but, by passing through great tule beds, it has been stopped on the way, so that by the time the water reached the San Joaquin river it was in a pretty clear state. Nature has pointed out to us what to do on the Sacramento river. You have there the sands of acres of tule lands situated in a way that you can utilize them as the tule lands on the San Joaquin were utilized, so as to prevent damage to the river.

Congressman E. F. Loud then addressed the Convention, saying: "It did not need the admonition of the convention to tell me that there is a feeling among the gentlemen of this convention, or a desire, rather, to get down to their work, and to return to their homes as soon and as speedily as possible. Understanding that, I shall detain you but a very few moments. In the early days before the war, I did a little mining in this State, but that is so long ago that my hands have become so softened of late years and my body so weighty that I find that I would make but a poor miner to-day. It is for you, as representatives of the mining interests of this State, to formulate such instructions and such resolutions as will seek to guide us in the halls of Congress in forming such legislation as will redound to the credit and to the interest of the State of California.

I have heard discussed here this afternoon the iniquitous decisions of the present administration. Being a Republican, of course some time ago I thought we should have a change of administration, but, hearing it from the lips of an old Jeffersonian Democrat this afternoon, I have become more firmly convinced than ever that we should have a change at least, in the Interior Department —

MR. CAMINETTI (interrupting): Mr. Chairman: I think the gentleman is going outside of the bounds of this discussion. I want to tell you that it is the Commissioner of the Land Office who has decided wrong, and that our Democratic Secretary of the Interior has overruled him.

THE CHAIRMAN: Gentlemen, it is very improper to bring politics into this body; I urge you at all times and upon all occasions to drop any reference to either of the great parties or to the younger party, the Populist. We are here for one common purpose, Democrat, Republican, Populist and Prohibitionist, all upon the same platform, working for the same purpose, and in my capacity as Chairman of this Association I recognize no man for his political convictions. I believe in every man working shoulder to shoulder with his neighbor, to carry this object that we are associated together for to a successful determination.

MR. LOUD: Mr. Chairman, I trust that I have not transgressed farther than those who have preceded me on political questions. Surely nothing that I have said has been said other than in a spirit of facetiousness. I do not desire to bring a political discussion before this body. Far be it from my intention.

More than $150,000,000 has been expended in the improvements of our rivers and harbors primarily, and having in view principally the object of giving the farmers of this country an outlet for the products of their farms. Now then, I believe that the same policy of protection should be extended to the mining interests, not only for the State of California, but for the whole far West. I am not here to dictate to or to advise you as to what you should do. Following out the policy that has been in vogue for many years, I believe that this country should expend money, that the gold hidden in the gravel should be brought to the surface. I believe that money should be expended upon our rivers, if it becomes necessary, that the miner may again go to work in the hills and bring from eight to ten millions of gold a year to put in circulation in this land.

Now then, to that policy I say steadily adhere in Congress. It is not necessary for me to pledge you here in my feeble way, for I have done all I could to further the interests of the miners in this State. The farmer cannot be successful until we shall dig from the earth money to put into circulation, that we can live in a civilized land and not go back to the days of poverty.

I cannot pledge you that I will carry out every proposition, possibly, that you may advocate or endorse, but I pledge you here and now, I shall in the future, as in the past, advocate such measures as will allow again the miners in our hills and in the mountains to go to work and make our land rich and prosperous.

SECOND DAY—EVENING SESSION.

The convention was called to order for an evening session on the second day, President Neff in the

chair. The president stated that Judge Searles had been invited, and had consented to address the convention on the subject of "The California Miner." Judge Searles then came forward and addressed the Association as follows:

Mr. President and Gentlemen: It is true that some time since I was invited to prepare a paper for this convention and was given as a subject "The California Miner." It was a subject that was congenial to me; a subject concerning which, notwithstanding my limited knowledge, I believed that I knew something. Having slept with them, having run with them—having done a good many things with them that perhaps ought not to have been done, as well as some that were highly meritorious, I found that from my opportunities of observing and from my experience I was somewhat familiar with them. But my conception of the California miner is so high, and my admiration for him is so great, that I could not consent to do anything of the kind without giving such attention and time to the subject as I thought due to the California miner. Being compelled to work all the time and being overwhelmed with work, and having had no opportunity to devote any attention to the subject, I therefore respectfully declined.

Having put a veto on that matter, there is not much else I can say to you, for the reason that I have not been with you during your councils, and I am not to any considerable extent aware of the subjects brought before you for discussion. You all know that a man cannot tell a good story until he has heard two or three, and then the storehouse of his knowledge on that subject is opened up before him. So is it with speaking. We want our feelings, our minds and our hearts to be wise, and we want to take an interest in it; and if the audience is sober we want to be sober also.

It seems to me that California has exceeded herself in the personnel of this convention. I have no desire to flatter you old baldheaded fellows; but in point of intelligence it seems to me that this convention vies with any like convention that has preceded it. Therefore we may hope that in your deliberations great good will result. From the reports that I heard of your afternoon proceedings, I think that if any of us were to get out of order, our good president will quickly call us to account. I am told that he "speaks right out in meeting" if he has anything to say. I shall keep within very narrow bounds therefore. When your Committees on Resolutions and Legislation have reported there will be something to think about, and when the majority are thinking the minority are very much inclined to talk.

THE PRESIDENT: I see that we have preseut Mr. A. H. Rose, our State Commissioner of Public Works, and we will be pleased to hear from him.

Mr. Rosc then advanced to the platform, was introduced to the Association by the president, and made the following remarks:

Mr. President and Gentlemen of the Association: It is not my purpose to make you a speech to-night. If I were gifted as Judge Searles is, it would give me great pleasure to talk to this Association. I believe that there is much to be said, much that is of interest, and much that would be valuable to the gentlemen here assembled. I am not, however, gifted in that way. I am not in the babit of making speeebes. I was many years engaged in the occupation of mining, many years ago, and I have not lost my love for the mines or the miner. My sympathies are largely enlisted in the business in which you are engaged. I am a valley man, by the way, and have lived in tbe valley for a number of years. Notwithstanding that, I think I can speak disinterestedly in what I may say, and what I will say will be, I think, for the benefit of both sides of this question, if one can say that there are two sides to it. I think, however, that there is but one side to tbe question on which you are assembled.

I recognize the fact that at this time money is what California and the country adjacent to it most needs. I realize tbat money is nearer the reach of the people of tbis country through the miners than any other source that can be made available within the next few years, or perhaps a great number of years, and if feasible to make hydraulic mining yield as it once did to the miners. I assure you, gentlemen, that anything that lies within my power will be given to aid you. That will not be much, but whatever it is, whatever it is worth, is yours.

For a period of about a year and a half I have been engaged in examining the question of the drainage of the valley, for the purpose of reclaiming the large area of swamp and overflowed lands in the two great valleys of the Sacramento and the San Joaquin, or if you please, tbe great valley of California. In the course of my investigations I have conceived the idea tbat there is a perfect and an absolute solution to the difficulties existing between the hydraulic miner and the valley or tbe river people. If I am right in my ideas, tbe suggestions that I have to make to you may be worth something.

The American basin, so known, situated between tbe American river on the south and Bear river on the north, is a body of land tbat is now almost wholly worthless, covering an area of 110 square miles of territory and susceptible of being filled to a depth ranging from twenty to forty feet, as necessity might require, and in my judgment, as a result of the investigations that I have made, it is feasible to turn into that basin the Bear river, the Yuba river and the American river, thus making that basin a settling pool for the debris that shall come from the mines, and hy that means dispose of the question of hydraulic mining which has been in contention between the valley and the mountains.

That basin is capable of holding a very large amount of debris, if you will figure on it. If I am right the debris from the mines can be brought into that basin, the debris settled there, and the water passed out into the Sacramento river practically clear.

Would that be a solution of this question? It would dispose of the debris practically from all the hydraulic mines of this State. There has been no question so far as the southern part of the valley is concerned, and that has not been in contention. If this proposition is a sound one it would dispose of the question of all the hydraulic ground that is very important in the northern end of the State. True, it would not take care of the Feather river, hut the water of that river is to-day clear, and nobody complains of it. It would dispose of all in regard to which there is any contention today.

Mr. Cross told you to-day that he believed that there was as much gold in the hills of Nevada county alone as had been taken out altogether in the State of California since the discovery of gold, which would he about fourteen hundred millions of dollars. If there is half that much money in those hills it will pay to make this reservoir that I speak about. If there is a quarter that much money in those hills it will pay. If there is three hundred million dollars within the limits of Nevada county, by adding to that the adjacent territory it would be a paying proposition to make out of the territory I have described a reservoir that would dispose of this whole controversy.

You have entered upon a system of impounding the debris. It is done piece-meal all over your mining country, and it is more or less expensive. In the end you will find tbat you will spend two or three times as much in detail work as would be necessary to expend on this whole ground. It is not alone the taking care of tbe debris. If the valley is to be maintained, or if the rivers are to be maintained, it is essential to maintain the debris that is already in the canyons. Tbis proposition should effectually accomplish that result. For the accomplishment of this project there are no engineering difficulties in the way. I have employed the best engineers in the State and I have their unqualified opinion that no engineering difficulties whatever are in the way. The canal for the deviation of the Yuba river would be about forty-five miles long: the canal for the deviation of the Bear river would be about ten miles long, and for the American river it would be very short—probahly a mile or two miles. If that should he carried out it would forever, or for a time longer than the life of anybody within the sound of my voice, hold up the debris of all those rivers, and keep it out of the Sacramento river. It would improve and enlarge the carrying capacity of the river for the purposes of navigation, and he equally important for the purpose of hydraulic mining.

If this is a question in which both sides are equally interested, can it not be easily accomplished? In my study of the question I have thought so. I am about to make an estimate of the cost of such work. I had promised your Executive Committee an estimate of the same, and I will have it completed within a short time, and in accordance with that promise I will submit it to that committee.

You all know the great importance of the occupation of mining. You have heard more about that than I can tell you. You know it from your own people and you know it yourselves. You also know that the proposition of the clearing up of this question has been paramount within the mining region.

Mr. Sherwood of Yuba then made the following remarks:

The gentleman presents a proposition here that has never been before heard of in this country by either the United States engineers or the engineers of the State of California. I understand his proposition to be that the debris of the hydraulic mines should be deposited in the bay, or in the tule lands.

MR. ROSE: The proposition that I have suggested is to deposit the debris iu what is known as the American basin. There are no intervening rivers to prevent the accomplishment of the result, and as I stated it is a territory embracing about 110 square miles. There is abundance of fall. On Bear river there are some six feet to the mile. On Yuba river from Point Daguerre to the point of out-fall the fall is nearly four feet to the mile. That is ample for all purposes required. I am willing to stake my reputation on that proposition.

MR. SHERWOOD: This is a matter of demonstration, and you are in an official position to demonstrate that fact. I want to say that it has never before been asserted as the solution of hydraulic mining that it can be carried on by permitting those that manipulate it in auy shape or form, whether it be by foreigners or our men at home, to turu their talings and dump it into the tules that adjoin land of mine. There is no equity in this. While the gentleman represents a part of the valley, he does not represent the sentiment of the valley when he says you can turn your tailiugs in on my home and make it a soil on which to grow grapes, turnips or anything of that kind. We want this thing to be determined under the Commission, and I appeal to Mr. Rose and to these gentlemen on that. Hydraulic mining can be carried on under this Commission. If I am not mistaken, Mr. Rose is opposed to this Caminetti bill and this Commission.

MR. ROSE: As to that, you are entirely mistaken from first to last. I have recognized the Caminetti bill from the first as a measure that was proper and desirable, and which is accomplishing a great deal of good. In presenting this proposition I only presented the physical features of it. I did not go into the details of how this was to be accomplished. I did not say it was proposed to be taken from the owners of the land for this basin. Of course I understand that if the land is to be taken from the parties who own it, that they should be compensated. No commission has yet reported upon this subject, but I say I have examined the proposition with as good engineers as there are upon this coast, and I say it would be a solution of the proposition if carried out upon those lines, and it would then go along as it did before there was any litigation on the subject.

Mr. Caminetti then made the following remarks:

During the last session of Congress an arrangement was made to bring out the Committee of the Lower House in order to give them an ocular demonstration of the building of a dam at Daguerre Point. I telegraphed to Mr. Rose and to the Miners' Convention, telling them that the House Committee was ready to come. Mr. Rose immediately telegraphed me saying, "How much do you want to bring out that committee?" I answered that I thought about $3,000 would do it, and Mr. Rose at once answered, "Draw on me for $1,500 to do that." I know that he speaks from the bottom of his heart. I telegraphed the other members of the committee, but I got no response. If I had gotten that I think we would have secured the dam at Daguerre Point, Mr. Chairman.

THE PRESIDENT: I see in this body an honorable and distinguished member of Congress, Mr. Francis G. Newlauds of the State of Nevada, and I ask him to come forward and address you.

Mr. Newlands advanced to the platform, was introduced by the chairman, and made the following remarks:

Mr. Chairman and Gentlemen of the Association: Two years ago I had the pleasure of addressing the members of the Mining Association of California, just after I had been elected to the Congress of the United States from the State of Nevada. I promised then that I would do everything that I could to advance the mining interests of California, and particularly hydraulic mining. Since that time the Congress of the United States, to which I belong, has been convened in one session of almost a year in duration. The main purpose of this Congress seems to have been to subject us first to financial impediments, making us dependent upon foreign countries by impairing our rights to resort to our own mines for money, compelling us to resort to the humiliation of stored gold in the foreign countries, and secondly by subjecting us to the industrial stress in foreign countries by a certain industrial stress witb which you are all familiar.

A bill has been introduced in Congress bearing my name for which this Association is really responsible.

With reference to this bill I will say that I am in full accord with all of its provisions, and that it has been fully considered in the Committee on Mines and Mining, of which I am a member. Most of the members of that committee come from the Eastern and Southern States, and when I say Eastern States I refer to that part of the country east of the Missouri river.

I am glad to say that that law recognized the importance of the mining industry. During that session, under the instructions of Mr. Caminetti and myself, the members of that committee have developed into pretty good miners. I believe tbat there exists in that committee a sentiment which will he in the main favorable to the bill which you have elaborated. I shall be glad to have the assistance of Mr. Caminetti at the short session of this Congress. I recognize in him one of the ablest and most pertinacious members of the California representatives. I only regret that at the following session of Congress we will not have the benefit of Mr. Caminetti's labors and assistance.

You are doubtless awaie that one of the purposes of this hill was to exemplify the proofs that a miner has to make to his claim that is contested. With reference to that we have found considerable difficulty in impressing the farming and agricultural sentiments of the Eastern and Southern States in the committee. You all know of the decisions of the Land Office, given as a rule by clerks, men who are unfamilar with the mining regions, and the presumptions which prevail there are very unsatisfactory, and an effort bas been made in this bill to determine the rules of evidence which shall control these mining contests, and to determine the presumptions clearly and conclusively of mining helts and regions in favor of the miners. The sentiment of the Land Office has been against that, and the sentiment of the average farmer in Congress is against it, for they say, "Why should not the rules of evidence be left according to the hooks, and why should they he laid down hy an Act of Congress with a particular intent to affect them?"

It is possible that there may he a hill introduced in this next session aiming in that direction. But I wish to say to you that a wise solution of this proposition would be to submit all these contests to the court, and to take away entirely from the Land Offices and the Land Office at Washington the determination of these contested questions. Then the mining contestant will have justice, even though the rule of evidence be not declared in the law in his favor. We all know that a rule of the vicinage prevails in all contests. The sentiment of the neighborhood prevails in all these contests. And in the region which constitutes clearly and unequivocally the mining helt the presumptions will be in favor of his claim. I therefore suggested to the committee of the Miners' Association that they should take this matter under consideration, this question of the Newlands' bill, with a view to settling all these disturbances.

I can only reiterate what I have already often said, that I stand in Congress as the representative of every western interest, without regard to State lines; that I believe thoroughly in the development of the mining interest, which I believe to-day stands as the basis of all civilization; and I stand ready to do everything I can in Congress to advance that interest.

I believe that a man or a community or a State that impedes for one moment the production of the precious metals, either gold or silver, commits a crime against nature. The production of the precious metals not only adds to the productive wealth of the world, but also increases the volume of the medium of exchange that is facilitating all the business transactions, sustaining and even raising all the land. It is not merely an industry, it is a benefaction to mankind.

My friends, I believe that the money of the constitution is gold and silver. I believe in primary moneys. I believe in the precious metals, gold and silver, which, as John Sberman declared some years ago, were ordained by God Almighty as the money metal of the world.

You are too peculiarly interested in the question of gold not to be insensible to your friends to the east of you, who are more interested in the production of silver. History records the fact throughout the ages that civilization has advanced whenever the mines were productive, and that it has declined whenever the mines failed to yield. Thoughtful men, tbe philosophers and historians of the world, have declared that the periods of barbarism, the dark ages of the world, have been created by the loss of the precious metals. Up to 1873 tbe products of the mines were welcomed by all humanity. Whenever the mines produced more freely of gold, or more freely of silver, whichever the case might be, the increased output was welcomed as an advance of civilization, and the revivifying effect was felt of prosperity, of happiness and general civilization.

There has been no epoch in the world so fruitful of advance, so fruitful of prosperity, so fruitful of general effort and general happiness as the epoch of the world after the discovery of gold in California and Australia in 1850. It remained for the financiers of this, the nineteenth century, in the year 1873, to put an artificial shrinkage upon the production of the precious metals. That restraint was placed upon the public in this, the country devoted to freedom, to liberty, to advancement and to civilization. In 1873 the United States took the lead in the attack upon silver. God knows how the fatal Act was inspired or where it originated, but no greater crime against the advancement of civilization has been committed.

Had this country in 1873 heen a colony of Great Britain, and had Great Britain then declared by law, or by edict, that the silver mines of America, then abundant in their richness, should he closed, and that not an ounce of their silver should obtain access to the mints of the country and be turned into coin, the people of the English colonies would have met Great Britain with arms in their hands. By stealthy legislation, the history of which no man is able to place, by a bill which the legislators who passed it were unconscious, of which the President who signed it knew nothing of its fatal contents, silver was demonotized. It was not only denied legal tender, but the people of this country, the owners of bullion, were denied the privilege of taking an ounce of their bullion to the mints of the country and have it turned into coin. Then commenced that agitation with which you are all familiar, an agitation lasting from 1873 up to the present moment. Distinguished by two advances in progressive legislation, one the passage of the Bland Bill and the other the passage of the Sherman Bill, both falling short of the recognition of silver as a metal, but both progressive in their character. At the last session of tbis infamous Congress of which I am a member, every vestage of legislation providing for the use of silver was stricken from our statute book. And to-day no owner of silver bullion in tbis country can take an ounce of it to the mint of the government and have it turned into current coin. We have thrown ourselves upon the mercy of foreign countries, notably of England, which through its system of manufactures and commerce has accumulated the gold coin of the world. We have now to go to that country from whicb we, in 1776, declared our independence, and upon bended knees pray for the gold essential to our existence.

Now my friends we propose to right this wrong. Even though we have to destroy the two existing great parties of the country. It is history to do it. I believe in a true American policy. I believe that the mining of the precious metals is the most important industry in this country. It is important simply as an industry, for it involves one-third tbe area of the entire country. It is important also because it gives an annually increasing product to that money volume which is necessary to the increased product and prosperity throughout the world.

For twenty years we have witnessed the increased value of the gold dollar. Day by day and year by year it has been going on, until to-day it commands twice as much of the products of your labor as it did in 1873. Twice as much wood, twice as much wool, twice as much of farms, twice as much of land, twice as much of real estate, twice as much of all the products of labor, twice as much of labor itself. We have legislated for a selfish clique, organized in the greatest money centers throughout the world, controlling public sentiments and public legislation. When you recollect that as against that selfish horde of public conspirators, the money barons of the world, are the men of enterprise and men that will advance civilization throughout the world, just think how the latter outnumber the former. They are as 999 to 1, and they, the 999, are enslaved by the one.

My friends, this thing means human labor. It means that a mortgage shall not he equivalent to a deed. The present system means tbat tbe mortgage is to be transferred into a deed, and that the margin which belongs to the borrower, the man of spirit and the man of enterprise, is to be turned over to the money lenders of the world.

We men of the silver region believe in both metals. We believe that they are both royal metals. We believe that they are the primary money of the world, and we believe that tbeir production should not he restricted. We believe that the mines of this State and of every other State stand above every other industry, whether it he agricultural, commercial or manufacturing. We stand with you of California in what you desire, and we stand ready to aid you. We also ask you to stand by us, with courage to help us in this great work, which means the regeneration of the world and of humanity.

Mr. Voorhies of Amador stated that the secretary had the report of the Committee on Resolutions, which report the secretary read. The resolutions were published as adopted in the PRESS of last week.

MR. SHERWOOD, of Yuba, then made the following remarks: That report provides to endorse the present bill of the Legislature of the State of California appropriating $250,000 to be used when the general Government shall appropriate a like amount. While you endorse that I want to have it incorporated that we, the miners of California, believe that that is correct so far as it goes; but if the general Government does not appropriate $250,000, and they should only appropriate $50,000, we believe that the State of California will appropriate a like amount. That is what we should have incorporated there. Mr. Caminetti fought for the appropriation in the last session of Congress, and I believe it was defeated by some valley crank. I move as an amendment that it be $250,000 or less.

MR. CAMINETTI: I second the motion. I think the gentleman's idea is that if Congress should appropriate only $50,000 to go ahead.

MR. SHERWOOD: That is is.

(*Continued on page 349.*)

Investments in Mines.

The following address was delivered by Senator C. W. Cross before the Miners' Convention:

Mr. Chairman and Gentlemen of the Convention:—I feel considerably embarrassed at being called upon to address you after the distinguished gentlemen who have already so handsomely entertained you. With others who have been co-operating in this movement of the miners to do something for themselves, and watching the cause and trying to help a little here and there where I could, as the rest of you have been and are disposed to do, in hearing these discussions one aspect of the mining situation has presented itself to my mind. It has not yet been discussed before this body.

I lived for many years in the California mining county which from the first has produced the most gold, and have had an opportunity to see something of the advantages and the disadvantages, the assistance and the difficulties, under which the gold miner lives. While the proposition of doing things by legislation, by miners' meetings and by co-operation are of course important and deserve all the attention that they have received, yet, while I have been living for a few years in San Francisco, another aspect of the mining question has presented itself with great force to my mind. If you are inclined to hear me, I will discuss it for a few minutes. It is not the legislative aspect—one which I consider very important and which I have discussed at previous miners' meetings; it is not the fact of our getting together and enthusing each other as miners, but it is purely the business aspect, which our miners are now assuming. I wish that I was more of a business man so I could present this matter from a business man's standpoint. I wish that I was a capitalist so I could understand the views which a capitalist takes of a question of this kind. While all gold miners of California need some legislation, especially with reference to the hydraulic mines and rivers; while we need some legislation to protect the claims which the miners make and to enable them to obtain title—a permanent, recognized title—to these claims, we need a different feeling among the business men and especially among the capitalists of San Francisco and California, with regard to investments in mines, from any feeling which has shown itself in recent years. I am not one of those who share the glory of having been a pioneer; I am not one of those who have helped to make the early history of the State. I have only been a resident of the State some twenty-two years or more, and I have only spent ten years of that time as a resident of a mining county. One reason why gold mining has not attained greater prosperity in the State of California and is not more broadcast as a means of livelihood and is not more made an investment by the capitalist for the purpose of obtaining a profit on his outlay, is a question which ought to be carefully considered. Few men, even among the miners, realize the vast amount of gold that lies hidden in the west slope of the Sierra Nevada mountains. Statistics show that more than a billion and a quarter of gold has been extracted from the gold mines of California, and yet a man who is familiar with the mining regions knows that the vast deposits have only been scratched at the surface and that only a small portion of the surface indications have been followed to determine the value of the deposits beneath and to extract what every experienced miner knows lies in the gold fields of California. If a man should state the probable amount of gold which can be properly mined within the gold fields of California, he would be looked upon as a mere visionary. Those of you who live in the mountain counties and who know of the little excavations that have been made here and there in the gold fields, and who also know that more than a billion and a quarter of gold bullion has resulted from that mining, have some understanding of the vast treasures still remaining.

I lived for many years in Nevada county, and I do not hesitate to say that not one in twenty of the known quartz veins had been worked to a depth of 100 feet; only a very few to the depth of 500 feet; and hardly any, not a half dozen, to the depth of 2000 feet on the dip of the ledge. I believe—and I believe I have good reason for believing—that in the single county of Nevada there is yet more gold that can be profitably mined and extracted from the earth than all the gold that has been taken out in the State of California. And yet that county, with a narrow width, merely crosses a gold belt that extends through eighteen counties and does not include the counties of southern California, which are now beginning to show a considerable production of gold. I believe there is yet to be mined in the State of California twice more gold than all the gold now in circulation in the world. I believe that the geology will sustain the contention. I believe that the experienced local miner in California who will make an estimate of what there is in a given area in his vicinity, and will multiply it by the extent of the gold fields of California, will more than double that estimate.

There are difficulties about gold mining; there are difficulties about obtaining investments that no other business presents, or in the history of the world ever has presented. Those difficulties and those disadvantages are partially the fault of the miners and the residents of the mining counties. Those who are familiar with the business of mining know that a very large share of all of the mining of the State to-day is done by men whom the miners call "prospectors"—men without capital—without capital except that capital which their muscle and their intelligence furnishes. Many of them, when they go out on a prospecting trip, have to go to the nearest store and buy upon credit their pick and shovel, their prospecting outfit and the grub they are to consume while they are to do their prospecting.

I call your attention to another thing, that is that there has hardly been a mining investment in the State of California, which has been made with care, with the business consideration and with the good judgment which men use in making investments in other lines of business. I say there has hardly been such an investment which has not returned handsome profits to the capitalist who has made the investment. Some statistics made public at a recent meeting of the Executive Committee of the Miners' Association show that the average result of one man engaged in the labor of mining in the State of California is nearly four times the average result of each man's labor in the business of agriculture and horticulture in the United States. These figures should be known; they should be appreciated and understood, and availed of by the men who have money in San Francisco and other cities. They show more: they show that the average profit of one dollar legitimately invested in gold mining in California, is on the average more than eighteen times as much as it is on a dollar invested in agricultural pursuits in the United States. These figures should be considered and pondered over and understood by the man who has money that he wishes to invest in a profitable business.

But the mining industry, when you seek an investment in the opening and development of a mine, has great difficulties to overcome, which no other business has. In the State of California, a gold mine is not recognized as a security. You gentlemen who are identified with the business know that. The man who has an acre of wheat-producing land can go to his bank and borrow money on it. The man who has a plant for the manufacture of some of the various articles that are needed by the people of the United States is able to borrow money on his investment, and it is the history of all industries of California, as it is in other countries and in other States, that the man who carries on the business, who has the enterprise and the vigor to go in and inaugurate and carry forward an enterprise, as a rule is not the capitalist, but the man who has to go to the capitalist for money. Before me are many men who have tried to get men with money to put their money into mining enterprises, that were just as good as investments could be, but when they undertook to get that money and went to the capitalist, the capitalist who would loan upon almost anything else in the world would not put up his money to help forward the mining enterprise. This was a good deal the fault of the miners. For some of these things the miners themselves are to blame. For instance, some speculative man who knows how to drink champagne and to dispense it to others, comes into your mining community and picks up a property that the people of that community know is not a good investment, and we, as miners, have not had the courage and honesty in such cases to come forward and say to the proposed investor, "You are putting your money in the wrong place."

What has been the result? When such an investment as that has been made, as illustrated in investments in nearly all of our mining counties, and that investment has failed, it has been heralded to the men of the State, to the business men and capitalists of San Francisco, until they have come to think that the whole business of investment in mines is a dishonest and disreputable business. You owe it to yourselves as miners; you owe it to the business of gold mining; you owe it to the investing class of the State, and you owe it to decency and honesty, when you see such claims being put forward, to stand against them, for one such false move hurts the county in which it is made for years and prevents other legitimate investments from being made. One of the elements in this thing, perhaps the most serious of all, is the conscienceless mining expert, who is the man of all men who has done our gold mining industry more harm than any other kind of man. I am not speaking now of the educated, trained, conscientious mining expert, to whose support every honest miner should come. I am speaking of the man who writes two opinions, one good and the other bad, and he offers to put in the bad one if he is not paid, and the good one if he is.

There is not one of you who has been connected with the mining industry that has not met that kind of expert again and again.

The legitimate gold-mining investments of the State have made, almost without exception, the rich men of the State, where they have been made rich by legitimate means. There are men who will tell you that in this age a man cannot honestly become worth a million dollars. The State of California has men who have, with small beginnings, legitimately become worth a million of dollars each. They made it by legitimate means in the gold industry in the mines of California. The roll of these men would be the longest roll of men who have become rich in the State of California. I can name lots of them over; you know them among yourselves. I ask you to pick out of San Francisco instances in which a capitalist of this State has taken hold of a gold mining proposition, after having given it the same examination, consideration and attention that the proposed manufacturer gives to an investment—a man who has had his proposition intelligently examined and has made an investment after thorough and intelligent examination, with that degree of thoroughness and care and business attention that men engaged in other enterprises use—I ask you to name one man who has made a failure of such investment, and where you can find him. There is not a town in the State of 5000 people that has not a man who has put himself on the comfortable side of Easy street on account of having made a moderate investment in a legitimate gold-mining enterprise. You go to San Jose, to Oakland, to to Los Angeles, to San Bernardino, to San Buenaventura, Sacramento, and you come to San Francisco, and I know in each of these places people who have all the wealth they can properly desire, which has been honestly made out of investments in California and in gold mines. There was a time in California when the moneyed men sought the gold mines as an investment. The best financiers of the State went into it as an investment. Take such men as Ralston, such men as Judson, such men as the Colemans—I could name man after man for a long time who took pains to investigate the mines offered in the market, coming to the best conclusions they could come to, and, acting upon those determinations, put their money into mines, either took the supervision themselves or put in charge men whom they knew were competent to handle such properties, who always came out big winners. Some people talk of them as gamblers, but when they took chances they did not take such chances as they would take in any other known business, because the probabilities of making handsome profits being great in the gold mining business; and they have been greater since gold mining began than they have in any other business or any other place in the whole known world.

Now, our San Francisco community, which is headquarters on money matters, has not given this subject the attention they should have given it. If it is proposed by the Government of the United States to appoint some consul to a little island in the Pacific ocean which has a trade of $100,000 a year, the Chamber of Commerce will meet and pass resolutions to the Government of the United States that they take hold of that matter. But until the Miners' Association sprang up you did not hear that the Chamber of Commerce or anybody in San Francisco undertook as a body to encourage gold mining.

I believe, gentlemen of this convention, that we need in San Francisco something that we have not got. The president and secretary of this Association have tried to organize something of that kind, but have not yet succeeded. There should be in San Francisco some place in the nature of an exchange or headquarters for miners who have a property that they believe to be a good property, to come and leave the representation of that property, and there should be some one whose business it would be to see that these representations were correct, so that any one looking about for a mine would know where to get representations and pointers as to what to do and how to make his investment. Our Mining Bureau has done some good service in this direction, but it was not organized for that purpose. It was more a bureau of public information than a bureau of business enterprise. It was paid by the State and could not properly become a place of business enterprise, but only a place of public information. I believe that in the near future the miners of this State will realize the necessity, the importance and the benefits that would accrue from such undertaking as this. I am not business man enough to know just how it should be organized. But I know some things that should be avoided, because I have seen how badly they have worked.

Now, as to a gold mine ever becoming a basis of security, upon which the owner and gold miner can borrow money to prosecute his enterprise, I am not business man enough to point the way to accomplish that thing, but I am business man enough to know that not one-fifth of the men in this State are employed in the business of gold mining that should be employed in it. I am business man enough to know that there is nothing else that could do the community and business centers of this State so much good as large operations in the gold mining fields of California. We have in California a class of capitalists, and a good many of them of the younger sort, who have inherited their money from their fathers, who made it upon the prosperity of the fathers in gold mining in California in early days, without the faintest idea of ever investing a dollar in claims, although they are hunting for other kinds of investments. It is partially the fault of the miners that they have not made more effort to attract capital to their kind of business. We have had some gentlemen before us today discussing this matter. There is Governor Perkins, who is now U. S. Senator, who has not seen a year since he himself was mining in Butte county, who has not been backing up, in one way or another, gold mining enterprises, and he is backing them to-day. There is Timothy Guy Phelps; he is a man who has backed mining industries in California at one time or another and is backing such industries to-day. I presume that from the manner ex-Congressman Clanie speaks of these matters, that he is one of the men who follows this advice that he has given, and I suppose he has investments. The work in California to-day is carried on by three classes of men: One, the prospector who has no capital; next is the man upon a salary or earning a moderate income, who takes a few shares of stock in some gold mining company organized in the county, and week by week, as he is assessed, pays something into that mining enterprise; there are a few other men like Hayward, and Tevis & Haggin, and the Colemans and that class of men, who have learned the value of that kind of investments, who have an eye open where they can put their money to the best advantage, and they have grown rich on it, but there is another class who never think—and they are the largest class of capitalists—who never think of gold mining as a legitimate investment for some of their accumulations. Those people should be waked up. Such men as Jimmy Coleman, Frank J. Sullivan, and men of this State, who have inherited large fortunes, could make more money by putting a large share of what they have inherited into the gold mines of California by from three to ten times what they can make by building great buildings in San Francisco or by taking Government bonds or taking bank stock. It should be the business of you miners to get the business to them, if you can, in such a way that it will impress them and the business community of San Francisco in some way, as the result of this Miners' Convention, and give them to understand not merely that gold mining is a great industry, but it is to the personal interest and advantage by way of legitimate profits for the business men and capitalists of San Francisco to invest some money in gold mines in order that they may make some more money, make it sure and make it easy.

There is one thing about a gold mining investment that everybody does not know about. If a man manufactures something, he does not know what he is going to get for it; the price fluctuates up and down from overproduction and underproduction—one price one year and another price next year or next month; a man never knows what he is going to get for his product. He has to pay for it as he produces it; when he produces it it goes upon the shelves to be distributed upon credit to the wholesaler, and upon credit by the wholesaler to the jobber, and by the jobber on credit to the retailer, and a large proportion is sold by the retailer on credit. After awhile the money begins to come back. When you are producing you do not know the price you may get. You have to wait for a market to sell on, and when you have sold you have to give credit and you have to wait for your returns, and then you have to take chances of having the sheriff collect them for you. But in gold mining you clean up your sluices for a week's run or a month's run, and you ship the product to the United States Mint. If it is in there before one o'clock, you can come there the next day and get your entire product in twenty-dollar pieces. There is no question as to whether you have a market or not and what price you will get, and no question of credit in return for your product.

These things should be talked about. They should be forced upon people. They should be considered and understood. The man who owns a ship loads it with goods and sends it to Europe and gives credit at the other end of the line for the freight, and so it is with every other line of business. The gold mining business is a cash business. If we can get the people of San Francisco to understand it, for every hole in the ground in the counties now, within two years there will be three good mines in operation, and when the time comes not merely the gold miner of California will be a prosperous man, but it will bring prosperity to every business man who resides in the State. We are here not working for ourselves alone; we are working for all classes of business and people within the borders of our State.

The Successful Application of Electricity to the Operation of Mines.

The following paper was read by Lieut. W. F. C. Hasson at the Miners' Convention:

At the Electrical Congress, held during the World's Fair in Chicago, one of the most prominent engineers of one of the large manufacturing companies, stated that he regarded it the business of consulting engineers to assure the public of the practicability of electrical machinery for the transmission of power long distances.

The independent engineers, recognizing that the perfecting of electric machinery for long distance transmission would only keep pace with the demand for such machinery, have been compelled to rely more or less upon their own intelligence and reputation for honesty in advocating the investment of money in such enterprises.

Heretofore, the data furnished by the electrical companies has been very meagre, and it has been impossible for the engineer to satisfactorily give even preliminary estimates concerning the cost of machinery.

The past year has seen great advance in the standardizing of machines and the publication of sufficient information to enable the intelligent investigation of the feasibility of proposed transmissions.

So much has been written and said about the success and economy of the utilization of water power and the great variety of purposes it may serve when transformed into electricity, that numerous companies have been formed to transmit unlimited power unlimited distances.

Incipient electricians, armed with a few figures, great faith and little understanding, see fame and fortune ahead of them, and talk bravely of the possibilities of cheap power for railways, town lighting manufacturing and mining plants and irrigation machinery.

So powerful is the effect of a small conception of the possibilities of electricity that it apparently induces in the hopeful mind a great and firm belief in itself. Men who have a faint conception of the elementary principles of electricity unhesitatingly state their willingness to undertake the transmission of twenty thousand-horse power one hundred miles, under ground or water, as may be desired.

The variety of statements freely furnished investigators eaves them in an uncertain frame of mind as to whether there is any truth whatsoever in claims made for the various types of machinery.

California has not been particularly happy in its electrical progress. The tendency to accept new and apparently phenomenal projects with the hope of great returns for little outlay, has invariably ended in failure and prevented legitimate progress.

At the present day, the machines for ordinary railway, power or lighting purposes, are so perfected that there is no excuse for even the appearance of failure, or for undue cost for installations.

With regard to machines for the transmission of power long distances for multifarious purposes, there is still much that is vague.

Even the intelligent engineer is frequently perplexed by the conflicting data that he has at hand.

In many manufacturing industries the cost for fuel for

power is so small a percentage of the cost of raw material and labor that cheap power plays but a small part in the cost of the article manufactured.

The successful operation of many mines, however, is entirely dependent on cheap power for pumping, hoisting and milling purposes.

In localities where fuel is cheap, or water power is directly at hand, the commercial value of a mine depends entirely on the quality and quantity of ore.

Electrical plants for mining operation may be divided generally into three classes:

1st. Those for the transmission of power for one or a number of purposes, where the distance does not exceed two or three miles.

2d. Those for transmission of power considerable distances—that is, from five miles upwards, to be used for operating continuous and uniform loads, none of which is less than 30 H. P.

3d. Those for transmission of power considerable distances, to be used for a variety of purposes, such as mills, hoists, pumps, lights, etc.,—that is both uniform and varying loads.

The first class is easily provided for by the use of direct current apparatus, and in cases where there have been failures, the cause will invariably be found to be due to ignorant or careless engineering work.

The second class may be solved in most instances by the use of single phase alternating current apparatus, with or without the use of transformers depending on the distance.

The economic point at which it is advisable to use transformers in order to transmit at a higher pressure than may be safely generated in the machine may be easily determined.

Although there was considerable difficulty in getting into successful working order the only plants of this nature in operation in California at present, it was due entirely to the failure on the part of the engineers of the electrical manufacturing company to intelligently investigate the circumstances under which the machinery was to operate.

These obstacles have now been entirely overcome, and machinery of this type, properly installed, can be guaranteed to operate safely and continuously.

The third class requires, at the present stage of electrical science, the use of multiphase apparatus, and will in almost all cases, require transformers, in order that the cost for copper for the transmission line may be kept within reasonable limits.

The plans for such an installation require the most intelligent engineering thought, and a plant installed at haphazard, with the idea that it will furnish power for the operation of hoists and other intermittent loads, and at the same time operate mill machinery at a uniform speed and give a satisfactory lighting service will, in almost every case, prove to be a failure.

There are several companies in the United States that are prepared to manufacture the necessary machinery to meet any of the above circumstances, and further prepared to guarantee its successful operation.

It must be borne in mind, however, that a guarantee, however responsible the contractor may be, really means but little. Although the payment for machinery may be made dependent upon the fulfillment of the guarantee, this by no means compensates the purchaser for the money lost by delay and the consequent trouble and worry.

The only real safeguard is the selection of such machinery as is known to be successful, and to take every precaution that its selection and installation is placed in the hands of capable people, whose only interests is in the successful operation of the machinery and not in the profits accruing from its sale.

The vital question is the comparative cost of operation of the mine by electrical machinery and by steam or water power. In that connection there is presented for your consideration the absolute cost of electrical machinery and its operation, and the cost of the engine and boiler plant and its operation, to produce the equal results at the Standard Consolidated Mine at Bodie.

Mr. T. H. Leggett, the president of the mine, is one of the most progressive mining engineers in the State, and had the courage to install the first alternating current plant for long-distance transmission for power purposes only in California.

At the time the machinery was contracted for there was but little absolute assurance of its successful operation. That the electrical difficulties incident to the locality were little understood by the engineers of the contracting electrical company is evidenced by the fact that it required the greater portion of a year to get the machinery in successful operation.

The intelligent manner in which Mr. Leggett overcame the many unforseen difficulties that presented themselves reflects great credit upon him, and a knowledge of the results he has obtained is of great importance in the consideration of power transmission plants. The figures in this case are as follows:

Expense for electrical machines, water wheels, wire and pole line material, freight, and all construction and installation for a plant to develop 150 H. P. at the mill	$26,000
Total expense, including pipe line and power house and other buildings necessary	37,000
Estimated cost of engines, boilers, freight, construction, buildings, etc., for a high-grade steam plant to develop equal power	13,000

This leaves a balance in favor of steam machinery of $24,000 on first cost.

The expense for fuel for production of power for the year ending February, 1893, was	$22,700

This expense is completely wiped out by the use of electric machinery operated by water power.

Allowing $700 per annum for heating purposes, the annual saving in fuel becomes	$22,000
Assuming a period of operation extending over ten years, the amount expended in fuel at six per cent compound interest becomes	307,000
Against this must be charged the original expense and compound interest on the extra cost of electric plant over that of steam plant amounting to	43,000
The balance in favor of the electric plant is	264,000
The wisdom of the adoption of electric power in this instance is emphasized by the fact that the average annual dividends for the two years ending February, 1894, was	28,500

All circumstances remaining the same, the saving in fuel will practically double the dividends.

The cost of attendance for electric plant will be slightly in excess of that for steam plant, but the cost for maintenance and charge for deterioration should be less.

The Standard Consolidated Mining Company is now making arrangements to install an electric plant for the operation of hoists and mine machinery. This plant will effect an additional annual saving of $11,000 heretofore expended for fuel.

It is absolutely impossible to make a general statement that will be approximately correct as to the relative economy to be gained by the use of steam or electric power in all localities.

The variable items are: Distance to available water power; cost of development of water power; character of country through which pole line is to pass; local price for fuel and rates for labor; cost of transportation of freight to mine.

Eliminating certain of these points, and assuming other conditions to be equal to those at Bodie, which is a fairly remote point, an estimate has been made concerning the installation and operation of machinery for a forty-stamp gold quartz mine and mill under the following conditions:

Distance to available water power	20 miles
Capacity of generating plant	300 horse power
Type of machinery	Multiphase, alternating current
Transmission voltage	10,000 volts
Maximum loss in transmission	10 per cent

Demands for power: 90 H. P. for stamps, crushers and concentrators; 75 H. P. for hoist; 50 H. P. for pumps; 15 H. P. for electric lights.

Annual operation, 350 days of twenty-four hours each; estimated period of operation, ten years.

The cost of necessary electric and hydraulic machinery and wire for transmission, all f. o. b. San Francisco, together with expense for material and construction of pole line and stringing wires, should not exceed	$ 36,000
The cost of engines and boilers to produce equal results, with the exception of the electric lights, all f. o. b. San Francisco, would not be less than	10,000
Assuming cost of transportation and installation of the two classes of machinery to be practically the same, the difference in the first cost in favor of steam machinery becomes	26,000
This regarded as a ten years' investment at 6% compound interest represents	46,500
The annual difference in expense for fuel, operation, maintenance, insurance, taxes, etc., in favor of the electric and hydraulic plant will not be less than	40,000
Regarded as an annual investment at 6% compound interest, this in ten years amounts to	558,500
The total difference in favor of the electric plant thus becomes	512,000

From this, of course, must be deducted the accumulated value of the investment necessary for the development of the water power.

These estimates are not to be taken literally, but they truly represent the great margin there is in favor of the electric transmission of power, when the matter is considered on a business basis.

These results being true, and in one case they have been actually established, the question naturally arises as to why there should be any hesitation in the investment of money in power transmission enterprises, and why so little advantage has been taken of the possibilities that exist in that direction on the Pacific coast.

To this there are many answers:

1. The electrical manufacturing companies exploited the field and claimed to be prepared to meet the demands for mining machinery before such machinery had even been designed. Finding that a demand existed, machines were designed to meet ideal conditions. It is by no means surprising that when installed as ignorantly as they had been designed, many unforeseen obstacles prevented the successful operation of these machines. However, it was from a study of these difficulties, and the devising of methods for overcoming them, that perfected systems have finally been obtained.

Further, being themselves ignorant of the probable cost of machines the preliminary estimates were in many cases made so high as to prohibit their use. This is evidenced by the fact that at frequent intervals during the past two years estimates have been made for the cost of machinery to transmit 1000-horse power in Nevada county, and the present estimate is one-fourth of the original one.

2. There is a definite lack of confidence on the part of the mine owners as to the successful operation of electrical machinery, owing in part to the failures that have occurred, due to the causes stated, and in part to the fact that electricity is regarded as a very mysterious element.

The manufacturing of electrical machinery is no longer any more of a mystery than that of building engines and boilers.

One great error on the part of those investigating the feasibility of employing electric machinery has been that of relying on the manufacturing companies to freely do their preliminary engineering work.

Although the electrical manufacturing companies have been liberal in pioneer engineering work, their province is to make and sell machinery. If they are also called upon to do free engineering work in all parts of the world, and still make a profit on their machines, the prices of necessity must be made high accordingly.

It must be self-evident that in relying on the manufacturing company for engineering advice, the purchaser eliminates the possibility of that competition which he should desire. Further, an agent whose salary is dependent on commissions on sales should hardly be placed in the position of giving disinterested advice as to the practicability of any proposed enterprise.

3. In the conducting of any enterprise dependent on cheap power for its success, it would appear essential to retain control of the production of that power.

In the development of new industries in California, the tendency is always to look to foreign capital. If the venture fails, the foreign capitalist has a grievance that he ventilates and prevents investment in legitimate enterprises. If the venture succeeds, the chances are in favor of its becoming a monopoly, and the original enterprise is at its mercy.

In cases where there are groups of mines dependent on cheap power that requires capital only for its development, it is certainly advisable for the mine owners to strain every resource, in order to retain control of the power company.

In brief, of this you may rest assured:

Electric machinery, guaranteed to efficiently transmit power for multifarious purposes, can be purchased at moderate prices.

Carefully selected, properly installed, and controlled by companies governed by a financial policy that reaches beyond the moment, it can be made to play an important part in the development of the industries of the Pacific coast. You may accept it as an axiom that no electric transmission of power is absolutely impossible, considered as an engineering problem, although it may be thoroughly impracticable from a commercial standpoint.

With the revival of hydraulic mining and the economic methods now offered for the operation of mines requiring extensive power, it would appear that the mining industries of the Pacific coast, instead of being on the wane, are on the eve of a period of assured success; and the men who have devoted their time, money and energy to the maintenance of these industries during the time of depression are to be congratulated on the bright future in view.

The Hydraulic Gravel Elevator System in Hydraulic Mining.

The following paper was read before the Miners' Convention by R. H. Campbell of Siskiyou County:

I have deemed it proper to prepare for presentation to this convention, held under the auspicies of the California Miners' Association, a brief resume of the general conditions in which hydraulic mining has been conducted in this State and elsewhere, by means of the system of hydraulic gravel elevating through the use of hydraulic gravel elevators.

Although the system was introduced into use in this State say ten or more years ago, in certain mining districts, yet comparatively little seems to be known or understood by the mining fraternity of the scope of its practical operation, and having given the theory and practice of this system considerable attention in my own mining enterprises, and having acheived very satisfactory results, I beleive it to be due to my fellow miners, and to those who may contemplate becoming interested in hydraulic mining, to relate something of my practical experience in this line of industry.

All gravel miners are aware that there are certain peremptory conditions governing the successful operation of the ordinary hydraulic and sluicing system of mining.

First: A sufficient volume of water acting under a given pressure. Second: An outlet having a sufficient grade or descent to permit the washed material or debris to be carried away and disposed of by the natural force of the water to such place of deposit as will not interfere with further washing of the bank.

Water is indispensable, for without it sluicing cannot be accomplished.

It has always been held that where grade was lacking to carry away the debris, except it was hoisted by derricks or man power, that the deposit could not be profitably worked; but the adoption and use of hydraulic gravel elevators has obviated this latter difficulty and made it possible to wash and elevate the gravel at the same time, by the same water, and as rapidly as by the ordinary method of sluicing.

All miners appreciate good dump (to put it in the usual vocabulary of the miner). They like to send the debris over some steep cliff or down some deep canyon where it would not molest them again,—this is what the Pike county miners of our early days called "drap." They like good "drap."

A good story is told of one of those early day miners who had been troubled with a bad dump. He found a deposit of gravel where water was handy and a canyon hundreds of feet deep to dump into. He could not resist the temptation so he started to work sluicing. He did not stop to see whether there was any gold in the gravel or not but worked away enjoying his excellent dump, when a prospector came along and stopped to see his claim; it worked nicely and he supposed the man was making good pay, so he asked him how it was paying. "Pay? why, this never paid anything." "Why are you working it then?" "Why, because I have got such a good dump."

Auriferous gravel or placer deposits are found ranging from ten to sixty feet in depth, and in many districts of a greater depth, but in very many instances the natural slope or grade of the outlying ground is too slight to permit of the working of the deposits by piping or sluicing, and this frequently occurs in creek and river bars or beds when the gravel is known to be rich in gold.

It is in these places and under these natural conditions that the use of hydraulic gravel elevators will be found advantageous and, as a mater of fact, imperatively necessary for the proper and successful working of such deposits.

These conditions, so frequent in their occurence, brought a very crude system of elevating into use.

The first gravel elevator I saw in operation was an open sluice box placed at an upraise angle of about forty degrees, with an hydraulic nozzle placed at its bottom or entrance. This kept the pit comparatively dry and elevated all of the gravel sluiced to the box; it worked passably well except when the pit would be flooded and in that event the discharge from the nozzle would be smothered or drowned and consequently could not throw anything out of the pit. Then a suction of pipe was laid in the box and the stream from the nozzle diverted into it which would free the pit in a very short time when the suction of pipe would be removed and the elevating of the gravel he resumed.

This eventuated in making use of a closed pipe tube or upcast and several letters patent were obtained, many of which were faulty in device and construction and even now at this date the best are susceptible of certain improvements.

In the early experiments the upraise pipe was placed at an angle of from thirty to forty-five degrees, but it has since been found better to place it in a perpendicular position and apply the water or direct the nozzle at such an angle that air is admitted, and the capacity of elevation is such as to astonish the most experienced miners.

At Quartz Valley, in Siskiyou Co., where I have been carrying on hydraulic mining for fourteen years, I found much of my ground, and by far the best of it, too deep for working without the use of the elevator. I at once visited every elevator in the State that I could hear of; the result was that I contracted for an elevator of the Martin pattern, put it in and ran it with good success for five seasons. The quantity of water used through the elevator was 1000 inches under 248 foot pressure, using a six-inch nozzle with a fifteen-inch throat and a twenty inch upcast pipe. With this we elevated the material from two and sometimes three giants, using three and four-inch nozzles and 800 inches of water. The upper or discharge sluice was six feet in width with three per cent grade, fortified with 100 inches of extra water, making nearly 3000 inches in the main discharge sluice, and then we often had to wait on it to do its part.

The elevator carried everything through it in an instant of time, provided that no large boulders obstructed the entrance or throat section, and performed its allotted work continuously and never required rest, and, as one of my men facetiously remarked, "It gulped up everything that came to its maw and hollered for more."

Had the upper discharge flume been given greater capacity and the facilities for piping the gravel to the elevator entrance been proportionately increased, I hesitate to state what would have been its capacity, for it would appear incredible.

In this connection I deem it advisable to state that there is but one occurrence which can effect the capacity of the elevator in its operation of elevating gravel or other material, and this can only be occasioned by a superabundance of water through and from the giants used in piping, for it has been found that a superabundance of water will overload the elevator and its action become inert, whilst singular as the fact may seem under proper conditions of volume and pressure of water no overloading of gravel can occur. Touching upon the matter of wear and tear, much depends upon the nature and character of the material piped to the elevator. If it consists of heavy wash intermixed with heavy boulders, as in river bars, the wear will naturally be greater than if of hill or mountain clay, dirt and rock. As an indication of the amount of wear sustained during my operations at Quartz Valley, covering a period of five consecutive seasons, I deem it proper to state that the builders of the elevator furnished an extra set of chilled iron liners, which, however, were never used, the first set being only half worn at the end of the last season. There was considerable rock mixed with the deposit, but after being broken or sledged it was passed through the elevator.

The cost of repairs during this entire period was surprisingly inconsiderable, and I can safely state did not amount to $50 in that time. There were no stoppages incident to the operation of the elevator except occasioned by the washing down of a boulder too large to pass its throat section, which occasionally occurred, and I have a vivid remembrance that upon one occasion the gates were not touched nor the water shut off either night or day for a period of five weeks.

There is a prevalent idea that the adoption and use of these hydraulic gravel elevators may prove an expensive experiment. My experience, as related above, distinctly proves the contrary. The original cost of the necessary plant is inconsiderable, in view of the advantages to be gained; the cost of maintenance and attendance is but little more than the usual expenses incurred in the ordinary methods of hydraulic mining, and I am firmly of the opinion that where the proper conditions of a sufficient volume of water and an adequate pressure are available, that these elevators can and will be largely utilized in mining shallow places and operating in mining districts where the adjacent surface ground has too little fall or grade to carry away naturally the washed debris, and that they can also be advantageously utilized in elevating and impounding debris in the old and washed pits left in our early mining operations, where the tailings can be retained forever without detriment to the interests of the "honest grangers."

An Electrical Process for Saving Gold.

The following is from the Butte *Inter Mountain:*

Two young chemists of this city have applied for a patent on a device which practical metallurgists believe will revolutionize many of the methods now employed in the treatment of gold ore especially. That there is merit in the device is evidenced by the fact that the general manager of one of the largest smelters in Butte has purchased an interest in the appliance, and before long it is expected that a machine capable of treating a large amount of ore daily will be in active operation in Butte. The machine is known as Clark's Electric Chlorinator, and it is claimed to be a great improvement upon Theis' process of chloridizing gold ores. It was constructed and tested at the Western Iron Works during the past summer.

The apparatus consists of a cylinder sixteen feet long by two feet in diameter, made of staves two and a half inches thick and firmly bound at intervals along its length by iron bands. The cylinder is so constructed that the upper half can be removed when necessary to repair the interior. Passing through this cylinder is a wooden octagon shaft, provided with stuffing boxes and bearings at each end. Into this shaft is mortised a series of pins a spiral line its entire length. The pins perform the office of agitators, and also convey the ore pulp in the cylinder to be chloridized. In the interior of the cylinder, upon the bottom, extending its length, is a carbon plate, to which is connected the positive wire from the dynamo. Attached to both sides of the cylinder, upon the lower half, are boxes. The bottom of the boxes are four inches above and on a line with the carbon plates in the interior of the cylinder, which acts as anodes. About two inches above the bottom of the boxes a series of holes or slots are cut through the cylinder, in which a diaphram of any suitable material is placed to keep the pulp from passing into the boxes, but sufficiently porous to allow the current to pass with as little resistance as possible. In the bottom of the boxes is placed a bath of mercury about one inch deep, to act as the cathode, and connected by immersing a piece of copper plate, to which is attached the negative wire. The above is a description of but one section, of which all others in the series are similar. They are arranged on an inclined plane so that the ore after traveling the entire length of the upper cylinder discharges into the next one beneath, and after passing through it is discharged into the next, and so on until the capacity of the mill is attained, say twenty tons of twelve hours' retention for each ton. The pulp is then discharged into filtering tubs and filtered and washed and the gold precipitated by protosulphate of iron or sulphurous and sulphuretted hydrogen gases.

The electrical process of the apparatus is conducted as follows:

It is a well known fact that if a current of electricity is passed through a solution of salt (sodium chloride) the chlorine and oxygen comes off at the positive poles, while the sodium and hydrogen is liberated at the negative electrode. The apparatus is so constructed that the chlorine comes off in the cylinder under the ore is a nascent state, attracting any free coarse gold which settles upon the carbons by the agitation of the ores, while the excess of free chlorine dissolves the fine gold suspended in the body of the ore. The hydrogen and sodium hydrate comes off in the boxes outside of the cylinder and away from the ore, and is prevented to a very large extent from combining with the free chlorine in the cylinder by the porous diaphragm between the boxes and cylinders.

By the above construction the chlorine which is liberated in the cylinder in the ore remains in a comparatively free state and continues to accumulate and act upon the gold in the ore. The current of electricity decomposes part of the chloride of gold formed, and deposits it upon the mercury in the outside boxes, where it forms an amalgam, which is easily obtained, while the gold that remains in solution passes with the pulp through the last section and into the filtering tanks, where it is obtained as previously stated. The apparatus has been tested alongside of the barrel chlorinator with the same charge and under similar conditions, and in every instance gave higher saving than "Theis' Process" did. While it has never been tested upon a large practical scale, it gives evidence of being practical in every particular and be much cheaper.

Platinum.

"If platinum continues to advance gold will soon be no longer distinguishable as "the precious metal," said Xavier Detarge, of New York. "If it continues to advance at the rate it has in the past three years gold will be as cheap in comparison as silver is to gold. We have heard of Black Friday, and the fortunes made in cornering gold; we read every day of the corners made in corn, pork, wheat and other commodities, but if a man could have foreseen the advance and made a corner in a platinum he could have made a barrel of money. Since 1891 the price of platinum has increased five-fold and is still climbing. The cause of this tremendous advance is the demand for electrical purposes. Platinum has always been a scarce metal, hence the appreciation in price, for the output of the mines has not kept up with the demand. As electricity is applied more and more each year, the numberless uses, the demand and the price will increase, as no other metal so far as discovered will serve the electrician's purpose half so well, if at all."

Western Lead Smelting.

Western lead-smelting works receive for treatment almost every known ore of the precious metals, with the exception of low-grade gold quartz, says the Colorado *Mining Review*. A very common type of ore treated by them consists of mixed sulphides—galena, blende, pyrite, marcasite, arsenopyrite, stibnite, etc.,—which, when present in large quantities, are roasted before smelting, but also enter raw into the furnace charge in smaller amounts. Metallurgists with the conditions prevailing in the far west are sometimes exercised over the loss of a number of possible by-products in the usual system of reduction, and especially on account of the zinc. It is said, for instance, that the smelters are saving lead, and giving their main attention to that while letting zinc, which has a higher market value per unit, go to waste. This is quite true of the usual system, though the "bag" process arrests part of the zinc oxide and other volatile products, and the ordinary flues catch other portions, which however are utilized very imperfectly. Now the facts are these: There are very few lead mines in the far west which could be operated at a profit for the sake of the market value of the lead, as lead. There is always a demand at the smelters for heavy lead ores, of which the Cœur d'Alene mines and a few others produce large quantities, but this demand again is not for the lead as such, that is, to turn out lead for the market, but because it is the basis of the whole smelting industry in which lead is used as a collector of the precious metals. Besides this, the lead of the far west always carries more or less silver and a little gold. Although called lead-smelting, and rightly so from the technical standpoint, it is really, and from the commercial point of view, a process for the extraction of silver and gold in which lead is used as the collector of these metals. The lead itself is a by-product. It has a market value, of course, and, after being turned into base bullion and subsequently refined, the proceeds form a large item of income. On its own account, however, very little lead would be produced west of the Joplin district of Missouri and Kansas. The base bullion, requiring not merely a softening operation but a true refining process yields small quantities of other by-products, of which little account is made. As to zinc, so far from yielding a valuable by-products, it is regarded as a positive detriment in the lead-smelting process, and ores containing it are subject to deductions in price. The blende is also badly mixed with other volatile minerals, so that a distillation process would give an impure zinc. When the western country becomes more thickly settled, so that there is a larger local demand, and the long hauls to market are unnecessary, it is probable that the whole system of ore reduction may be changed, and brought into smelting like that of Germany, where practically everything of value is worried out of the ore by an elaborate system of concentration and classification, followed by special processes for the different classes of material. Under existing circumstances this would be impracticable, as would be also any general wet process, with electrolysis. The enormous cost for additional plant, the relatively high wages, the cost of transportation of ores from mines to work and of products from works to markets, stand in the way. While it would be desirable to utilize all the numerous accessory metals and substances—zinc, antimony, arsenic, sulphur, and many others in less amount—present in the mixed ores, in must be remembered that the lead-smelting industry of the west has been developed to a very high degree of efficiency, regarded in connection with peculiar conditions; and that even under obvious disadvantages it now leads the metallurgical practice of the world in its own sphere. To have brought the cost of smelting to within $4 per ton of neutral ore—fuel, flux, etc., has to be transported greater or less distances, and where labor is by no means cheap—is certainly a great achievement; and to do this with a technical success measured by a recovery of 95 per cent of the silver and lead, and more of the gold, is a still greater achievement. Those who find fault with present western methods do not realize either the intricacy of the conditions or the remarkable progress that has been made.

THE knowledge that nearly all clay contains aluminum, and that aluminum is every day becoming of greater importance from an industrial standpoint, tempts one to look with greedy eyes upon each clay bank he passes and make mental estimates of the wealth waiting to be shoveled out. The difficulty of obtaining the metal from clay, however, renders it prohibitive. Its chief source is bauxite, a mineral occurring in quantity in Arkansas and the southern Appalachian valley; but the continuity of the vein has not been determined.

Working Placers With Water Scarce.

A letter from Cerrillos, N. M., to the Denver *Mining Record* says:

Mr. H. H. Armstead of New York, president of the Gold Separator and Sluicing Company, has leased from the Irrigation and Hydraulic Mining Company, which has located and since 1885 held possession of 10,000 acres of mineral land in the Golden district, eighteen miles south of Cerrillos, several hundred acres of placers, and has on the ground and in course of erection a Brewster battery capable of handling 100 yards of dirt per day. The complete machine will handle 500 yards a day, but this part of it will be in operation by the 20th instant and a thorough test made. This machine was invented by Brewster of New York and is covered by sixteen patents. The one to be tried here is the fourth one ever set up complete with dirt cars, track, etc. The cost of the plant will approximate $50,000 and will give employment to several hundred men, mostly unskilled laborers. This is not a dry washer, but very little water is necessary. The dirt with which the test will be made is to be taken from 100 prospect holes dug at haphazard, but not less than 500 feet apart, a yard of earth being taken from each one. A sample will be taken from each lot and panned, and by comparison give an exact knowledge of what the machine will do.

For a long time every sort and condition of men have racked their brains to invent some sort of a machine of large capacity, either a dry washer or one which will require very little water, that can be used profitably in handling the dirt in the rich placer ground of the Golden and Dolores districts of New Mexico. Many have been tried and an enormous amount of money has been expended in the efforts, and whether it is the Brewster battery or some future invention which is to do the work, a gigantic fortune awaits the man who shall be lucky enough to succeed.

These districts have been worked for hundreds of years in a crude way by Indians, Spaniards, Mexicans and whites, and even now there are probably 650 men making a living there with small dry washers run by hand and for the most part working over the old dumps. These placer grounds extend over a large area, and though millions in gold have been taken out there are yet untold millions more awaiting the hand of man.

New Tin Plate Company.

The Indiana Tin Plate Manufacturing Company of Atlanta, Ind., were organized last week, and the following officers elected; C. A. Fore, president; F. D. Morgan, vice-president and general manager; Dan Goodykoonty, treasurer; E. S. Walton, secretary and assistant treasurer. The company were chartered under the name of the Atlanta Steel & Tin Company. Capital authorized $150,000. This company were originally incorporated in October, 1892, an eight stack-wash house was built and in the spring of 1893 the company commenced tinning, but owing to an impossibility to reconcile existing differences between the manager and the company a receiver was appointed, and the plant was recently sold for the benefit of the creditors. It is the intention of the new management to put in three stands of hot and three stands of cold rolls, ample capital having been raised for that purpose, the contracts for the engines, boilers, mill building, pickler, doublers and other machinery having already been let. This company will have the advantage of free natural gas for fuel, and will own 2,000 acres of gas territory southwest of Ellwood, Ind., being the very best gas territory in the Indiana gas belt. The mill will be arranged on the plan of the New Castle, Pa., plant; the mill building will be 80x280 feet; the wash or tin house, 50x100; pickling room, 30x80, and the assorting and packing room, 50x80. All brick and iron work will be commenced at once.—Chicago Journal of Commerce.

A Restraining Dam.

In an interview with Senator T. L. Ford, that gentleman informs the Nevada *Herald* that he recently had a talk with Lieutenant C. E. Gillette, of the Debris Commission, about dams. The Lieutenant is of the opinion that $500,000, or less, would build a dam at the Narrows that would last for all time and be large enough to hold all the debris for many years to come. He states that a dam could safely be built 250 feet high at that point, and with such a dam every mine on the Yuba river and all of its branches could turn the monitors loose as they used to, yet without the slightest injury to any navigable waters.

The Narrows is the most favorable spot of any for a retraining dam. It is a deep and narrow gorge, widening upstream and forming a great basin that would hold an immense amount of debris.

Now if the appropriations sought at the last session of the Legislature could be secured—if Congress could be induced to appropriate the $250,000 necessary to make the State's appropriation available—there is no reason why that dam should not be built.

Scientific Progress.

A Handy and Efficient Storage Battery.

The importance of the storage battery in future electrical work is beeoming daily more apparent. While in England and ou the European eontinent it is exteusively and successfully used, in America it has met with indifferent sueeess. The trouble here seems to be that storage batteries are worked with too small a margin of safety; we want to get too mueh out of them. As W. W. Criseom recently put it: "A storage battery continually worked to its commercial rating is a commercial failure. A storage battery worked sufficiently within its capacity is invariably a commercial success." A battery is now made that, while thirty per eent lighter than other batteries of corresponding capaeity, eau be worked well within its capacity, and still give most satisfactory service. It is of usual streugth and solidity, and will stand any amount of hard usage. The lead plates are so assembled as to expose a very large amount of active service to the action of the electrolyte. The battery can be rapidly, ecouomically and efficiently charged. It may be both overcharged and diseharged rapidly without detriment to the plates. In proof of this it is mentioned that a plant of these eells has been diseharged repeatedly, for the last sixteen months, at rates from one and a half to four amperes per pound of plate, and uot a siugle plate of the batteries submitted to those severe tests was "buckled," or warped. The "buckling," or bending of the plates after a period of wear, has always been a fatal defect of the storage battery, and this reeord is of value in showing a distiuct stride iu its eonstruction. The new battery is well suited to the runniug of eleetric launches, lighting, or any service where a high diseharge rate may be occasionally demanded, and it is claimed to be espeeially adapted for traction work.

Boiler Corrosion.

Corrosion in boilers has long been an annoyanee to steam users, and anything that will serve to prevent the immeuse loss following the condensation of so many short-lived boilers, to say nothing of the loss in efficiency of those eontinued iu service, and the danger that always aecompanies the use of a boiler thus affected is sure to meet with the approval of the progressive engineer and his employer.

The efficiency of zine suspended in water in preventing corrosion iu boilers is due to the fact that when two metals of a dissimilar character are immersed in a liquid capable of chemically acting on both of them, and are eonnected or in metallie eontact, the metal which is most affected or aeted on by excited medium becomes the positive or corroded element, and the other becomes the negative or inaetive element, thus escapiug corrosion as long as the metals are in contact. Zine being the most readily acted on, it becomes the corroded element, and concentrates and absorbs corrosion, which would attack the metal of the boiler if the zine were not present in metallic coutact; thus a very small quantity of zinc suspended in the water, or about two pounds weight of zinc per tou weight of the boiler, will prevent corrosion. When the water is good, or moderately pure, an enamel-like film or coating, efficiently protective against corrosion, may be given to the interior surfaces of a boiler, when clean, by using zine plates suspended in the water and adding common soda continuously to the feed water.

Another method used in the application of zine for this purpose is that of plaeing a ball of zinc, through which a bar of pure copper is passed, in a eage suspended in the water, and with this arrangement to connect the ball by wire to those parts of the boiler which suffer most from eorrosion.—Manufactures' Gazette.

CARBONUNDUM, the new abrasive and polishing material, bids fair to entirely supersede emery, eorundum, and even bort, the best and hardest snbstanee of this elass hitherto known. It is made of finely powdered eoke, common table salt and sand thoroughly mixed and subjected to the heat of an eleetrie furnaee for about fourteen hours. The eystals thus formed are washed, molded into the desired shape (usually that of wheels) and theu fired from four to six days. When the inventor came to New York in 1891, he carried all the earbonundum in the world with him in a two ounce bottle. The product in 1893 was 15,200 pounds. The inventor has reeently disposed of his Europeau patent rights for a very large sum, and retains his interest in the Amerieau eompany.

LORD KELVIN is of the opinion that the internal heat of the earth has no bearing whatever upon climates, contending that the intense heat known to have onee existed at the surfaee of the earth was due to a much higher temperature of the sun. The earth might be of the temperature of white hot iron 2,000 feet below the surfaee, or as eold as ice fifty feet below, without altering the preseut elimate in the least.

FROM the results of about ten thousand observatious taken simultaneously in Russia, Germany and Pennsylvania to determine the supposed oscillatiou of the earth's axis of rotation, it has been shown that the north pole moves in a spiral line from west to east. The motion is at present decreasing and is very small in auy case—probably not more than forty feet.

PROF. JOHN MILNE, the earthquake expert, who is eonnected with the Imperial University of Japan, states positively that the prevailing belief in a relation between earthquakes and magnetic disturbances is wholly unfouuded. His exhaustive investigations of the subject have proved that the one is not iu any way dependent upon the other.

NOT eonteut with the pneumatic tire, we have gone further and fared worse. An entirely pneumatic wheel has made its appearanee. It is a flattened ball of rubber with a tough outer eovering. Two metal plates hold the side of the wheel flat and are kept in plaee by a tube through whieh the axle passes.

THE heat developed by the firing of heavy guns is remarkable. Duriug some receut tests at Sandy Hook a gun that had been fired seveuty-five times melted solder placed upou the chase, while another was hot enough to soften lead, indieating a temperature of 600 degrees Fahrenheit.

Save the Minerals.

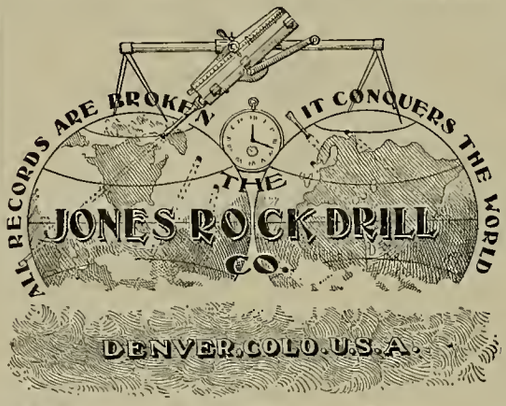
Quite a number of miners who are interested in mining property have called on us to see if their land is ineluded in the odd sections claimed by the railroad. This filing of the railroad compauy is for all unpatented lands in odd sections, and in this is ineluded the Dry Digging country east of town. As that is all mineral land, a protest will immediately be filed. If land is more valuable for minerals than for agricultural purposes, it should be saved from the clutches of the railroad for the prospectors and miners of this eounty. This affects a large portion of the land aloug Coyote creek, Grave ereek, Louse creek and all along Jump-off-Joe. Any oue who has unpatented mining property in odd sections who will write to us or call at this office giving the deseription of portions of the section in which they are located, we will look the matter up for them. This is a matter that should not be delayed, as the 6th of December is the day the chance of protest will close.—Grant's Pass Observer.

FOR SALE.
Two Mines of Free Milling Gold Ore.
For particulars address JAMES A. SCOTT, Reno, Nevada.

The Ideal Steam Oil Refiner
FOR STEAM POWER PLANTS.
The Purity Oil Filter
FOR WATER POWER PLANTS.
Will reclaim your waste oil and make it equal and often better than new oil. Will reduce your oil bills 50 per cent and save your bearings. In use with the largest and best plants everywhere.
For prices and particulars, address
D. M. DOUB, 137 First Street, San Francisco, Cal.

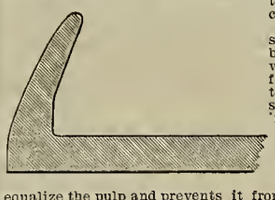
Attention Miners!
W. W. MONTAGUE & CO.
—ARE MANUFACTURERS OF—
Riveted Iron and Steel
Water Pipe
For Hydraulic Mining, Mills and Power Plants.
IRON, CUT, PUNCHED AND FORMED, AND TOOLS SUPPLIED FOR MAKING PIPE ON THE GROUND WHERE REQUIRED.
309 to 317 Market Street, San Francisco.

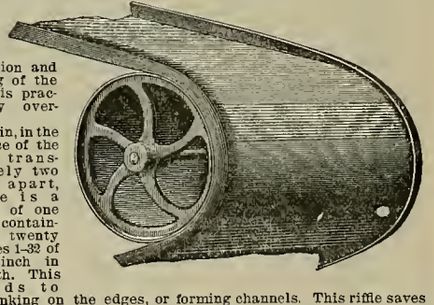
THE JONES ROCK DRILL
IS THE
Only Successful Hand Power Drilling Machine Ever Invented.



It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.
Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*
If you are interested in Rock Drilling correspond with us.
WE CAN SAVE YOU MONEY.
FRANK T. SUTHERLAND, M'g'r Pacific Coast Agency,
Office and Warerooms: 9 FREMONT St., San Francisco, Cal.
Or, Address the Company at its Denver Office.

Blasdel Improved Concentrating Belt.
We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.
Practical mill men must see at a glance the advantage of our belts over any other.
First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.
Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from hanking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.





H. G. BLASDEL, JR., Manager,
419 California Street, Haywards Building.....San Francisco.

Adamantine Shoes and Dies
—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.
These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.
Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

Mechanical Progress.

Steam vs. Gas Engines.

In a paper recently read before the English Institution of Gas Engineers, Mr. Bryan Donkin, so well known for his work in connection with steam, gas and oil engines, has drawn an interesting comparison of the results to be expected from engines of these types.

The notoriously inefficient small steam plants up to, say, fifty-horse power, operating under conditions that exist in so many places in this country to-day, and presumably in England as well, if the Manchester tests are any criterion, and barley touched upon, and not at all from a practical standpoint. This, writes W. H. Cothren, in *Electrical Engineering*, is the most promising field for internal combustion engines to-day. And in this country especially, oil engines, even of large size, should become important factors in power production, owing to the ease and cheapness with which the various refined products of petroleum may be obtained even in the remotest hamlet.

At present gas engines are made in England in sizes ranging from one-fourth to 600-indicated horse power, and there is a marked increase both in sizes and numbers sold. Some 7,000-horse power are there used for electric lighting alone, and it is estimated by the Messrs. Crossley, whose works last year turned out 2000 engines, that there are at least 20,000 employing the Otto cycle in use, and is presumable that there are as many more other varieties.

The use of ordinary lighting gas is customary in sizes up to ten-horse power, but for larger sizes a small, convenient apparatus has been devised for the prodution of a gas that cannot be used for illuminating purposes, but which gives very economical results when burned in an engine cylinder. This gas is most frequently called Dowson or generator gas, from the man who has done most to bring it into prominence. The best fuels for producing it are anthracite coal and gas coke, as they yield no tar. The thermal efficiency is low, it having about 160 heat units per cubic foot, as compared to 615 to 630 of London lighting gas, consequently about four times the quantity is required to produce the same amount of power. The great quantity obtained, however, together with the small amount of depreciation and labor required for production, make it in many cases comparable in cost to gas at twenty cents per thousand.

Gas engines labor under the disadvantage that they cannot be started under full load requiring the use of friction clutches, and in most cases they have but one impulse to each four movements of the piston, necessitating greater weight per horse power than with steam. On the other hand, the gas engines can be started instantly, and there is no danger from fire or standby losses when it is shut down. Neither is an attendant required to keep the boiler in operation. The disadvantages attendant upon the fewer impulses per minute are more theoretical than real, for the regulation of good engines is now sufficiently close for all practical purposes.

Improvement in Casting Metal.

Not only machinists, but all who have occasion to use machinery, will recognize the merit of a joint invention of residents of Fair Haven, Vt. It is designed to produce such a smooth surface on metal castings, both outside and in bores, as to render it unnecessary to use either tools with or without a lathe, before devoting them to the services for which they were made. It is especially applicable to the casting of such articles as pulleys and gear-wheels, but is susceptible of a more general use. Its object is not only to give a good finish without tool-working, but also to prevent the adhesion of the casting to the core or mould, and incidentally to modify the usual effect of the chill produced by metal cores and moulds.

The inventors, in the employment of their improved method, prefer metal cases or moulds; but to produce the best results, these appliances should have as smooth a surface as is attainable, as this, before molten metal is poured in, should be covered with a thin coat of asphalt, diluted with turpentine, benzine or some similar solvent. The liquid may be applied with a brush. They believe that the heated metal converts the asphalt, or part of it, into a gaseous cushion between the molten mass and the mould, and in that manner the chilling action of the latter is modified. But whether this be the correct theory or not, the results are said to be incredibly excellent. Indeed it is alleged that large screws may be cast by this method at one-third the cost of turning them, and that the product is equally smooth.

A Buffing Room.

There are many shops where the intelligent adoption of a buffing department would work wonders in saving time and labor on much finished work. Even if you have not work enough to employ a buffer steadily, it will pay to have the proper appliances and get a man who can turn his hand to other work in the spare moments, although it would be saving money over present management to give him half or even full pay when not employed. In finishing brass, iron or steel casting, or forged work, the saving effected by good buffing-wheels and straps, handled by an experienced man, seems incredible to those who are accustomed to using the file, scraper and emery-cloth block or stick, and the uniformity and quality of the work will be much improved.

The quality of wheels and straps, emery or other abrasive supplied will affect the saving largely, for it does not pay to use poor materials. Solid wheels, wooden wheels with leather faces or rims, hide wheels and felt wheels are all good for certain work if of good quality, and the same may be said of rag wheels and polishing materials. The wheels should be well balanced, especially the larger sizes, and should run about 5,000 feet per minute, rim speed. This demands strong wheels, and they should be carefully looked after to avoid bursting and injuring the workmen. In renewing the emery on the rim the old and worn material should be thoroughly removed by covering with damp clay; this will loosen the glue, and it can be easily scraped off after the glue becomes softened. This is far preferable to the "picking" or "chopping" method employed by some, as this injures the face of the wheel and is apt to make it run "out of true."—Machinery.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-brenker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

UNITARIAN LITERATURE sent free by the Channing Auxiliary of the First Unitarian Church, cor. Geary and Franklin Sts., San Francisco. Address as above. Mention this paper. *

Tuolumne Mining Bureau,

Sonora, Cal.

Developed and undeveloped mines for sale at lowest possible prices, for cash or bond. Correspondence and personal interviews solicited.

Assay office attached.

ROOM 1. - 426 CALIFORNIA STREET,
SAN FRANCISCO.

....The Greatest Book on Petroleum in any Language....

JUST READY.

PETROLEUM:

Its History, Origin, Occurrence, Production, Physical and Chemical Constitution, Technology, Examination and Uses; together with the Occurrence and Uses of Natural Gas. Edited chiefly from the German of Prof. Hans Hoefer and Dr. Alexander Veith, by William T. Brannt, author of "A Practical Treatise on Animal and Vegetable Fats and Oils." Illustrated by 8 plates and 284 engravings. 736 pages, 8vo. Price.....$7.50

ABSTRACT OF CONTENTS.—Chapter I. Introduction: History of Petroleum; History of the Petroleum industry in the United States, Galicia, Roumania, Russia and other countries. II. Division and Nomenclature of Bitumen. III. Physical and Physiological Properties of Petroleum. IV. Chemical Constitution of Petroleum. V. Occurrence of Petroleum. VI. Origin of Petroleum. VII. Boring, Conveyance, Transportation. VIII. Crude Oil. IX. Manufacture; Distillation, Condensation, Refining, Continuous Distillation, Production of Lubricating Oils. X. Manufacture of Paraffine. XI. Methods of Testing Oils. XII. Uses and Properties of Petroleum. XIII. Natural Gas and Gas Oils. Appendix. Index.

☞ *This volume will be sent by mail, free of postage, to any address in the world, or by express C. O. D., freight paid, to any address in the United States for $7.50.*

☞ *A circular of 8 pages, with specimens of the illustrations, showing the full Table of Contents, will be sent free to any one furnishing his address.*

WE ALSO PUBLISH

The Techno-Chemical Receipt Book:

Containing Several thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology, and their Practical Application in the Arts and the Industries. Edited chiefly from the German of Drs. Winckler, Elsner, Heintze, Mierzinski, Jacobsen, Koller, and Heinzerling. With additions by William T. Brannt and William H. Wahl, Ph.B. (Heid.), Secretary of the Franklin Institute, Philadelphia. Illustrated by 78 engravings, one volume, over 500 pages. 12mo, elegantly bound in scarlet cloth, gilt, closely printed, containing an immense amount and a great variety of matter.

Price $2.00, free of postage to any address in the world.

☞ *A circular of 32 pages, showing the full Table of Contents of this important Book, sent by mail free of postage to any one in any part of the World who will furnish his address.*

Electrical Progress.

Electric Lights Reduce Crime.

When Henry W. Jaehne was alderman he introduced and had adopted an ordinauce which provided for the lighting of West street by electric light, says the New York *Sun*. One early and good effect of this innovation was that the ueighborhood, which had previously been the resort of river thieves, footpads and miscellaneous criminals after the hours of nightfall, was much improved, and robberies ceased to be of frequeut occurence.

The neighborhood is one much frequeuted by market men, Clinton market being at the foot of Spring street, and Gansevoort market further north ou the same side of town. Mauy persons are obliged, by the demands of business, to traverse this portion of the west side late at night, and some of them find it necessary or desirable to carry with them considerable sums of money. The records of the Prince street statiou show, or rather did show until the station house was removed to Macdougal street, that following the introduction of these electric lights, robberies, previously numerous, dimiuished rapidly in this locality.

Since theu electric lighting has become pretty general in the streets of New York. Broadway, the Bowery, Eight avenue, Third avenue, Fourteenth street, Grand street, Park Row, One Hundred and Twenty-fifth street and other thoroughfares are now almost as well lighted by night as by day.

During the time that flickering gas lamps were depended upon for the illumination of the steets of New York, persons traveling at a late hour had very little protectiou from assault, as it was not possible for policemen, however faithful and diligent, to cover all posts. It was always in the power of thieves to "turn out the gas," thereby leaving a street in temporary darkness, and subjecting always a belated pedestrian to the libability of sudden and unexpected assault.

In the year 1884 there were 316 arrests—or one for every working day on the average—for street robbery in New York city. In 1885 the uumber increased to 332. Then the improvement in illumination came into effect, and in the year following the number of arrests for robbery was ouly 291. In 1888 it had falleu to 270. In 1890 it was 253. Iu 1892 it was 239, and last year the total number of arrests for robbery was only 232, showing the close counection between the diffusion of electric lights and the suppression of this form of felouious crime.

During the years succeeding 1884, the population of the city has been steading increasing, of course. If, therefore, the number of robberies committed in each year had remained precisely at the same figure, the ratio of robberies to the population would have steadily decreased, but there has been a double reductiou, for there are now fewer robberies than there were ten years ago in New York city, and the population has greatly increased during that time.

By the last report of the Commissioner of Public Works it appears that the city is paying for the lighting of 27,500 lamps, about 2,000 (mostly in the big thoroughfares) electric and the remainder ordinary gas lamps still in use on the side streets. The item of gas and electric lighting costs the city in a year about $900,000.

Refining Copper By Electrolysis.

For nearly forty years, beginning with 1845, the chief source of supply of domestic copper in this country was Michigau, the percentage coutributed by that State rauging from seventy to ninty per cent for a long time. Early in the 80s, however, Arizona became a conspicuous second in the list of producers, and then Montana quickly passed both that Territory and Michigan. She has held the first place for the last seven years. The resultant abundance has euabled us to export this metal largely, the amount seut abroad for the last decade averaging one-sixth to more than a third of our whole output, and the price falling to au astonishiugly low figure.

Of the total product of Montana, much the largest part (about three-fourths) now comes from Anacouda, with Butte a conspicuous secoud. For a time Anaconda sent a good deal of her smelted copper to Baltimore to be refined. But an euormous plant for couducting that operation by electrolysis has been erected at this chief center of Americau production, and, though uow only partially iu operation, it will soon be turning out fifty tons of pure copper a day. The Anaconda company meditates putting up a similar plant at Great Falls, Mont., nearly 150 miles away, where cheap coal and a magnificeut water power are available. The Butte companies have already been doing this for some time past. Even at Anaconda the work can be done for three-fifths of a cent per pound, and, therefore, the cost will be much less at Great Falls. As yet, the Anaconda company is able to refine only 30,000,000 pounds a year, which is less than one-third of its entire product; but it is arranging to refine the whole of its as soon as possible.

Copper and aluminum are the only metals produced on a large scale by electrolysis at present, but a large number of rarer ones are also separated from their salts aud other impurities in this manner. The plan pursued with copper is as follows: A large number of tanks are used, all containing a saturated solution of sulphate of copper. Into each are inserted the positive and uegative poles of a heavy conductor from electric generators. Separate couductors are not used for the different tanks, but the latter are placed "in series," so that the current flows from the positive terminal or cathode in one bath through the liquid to the anode, or negative terminal, and then along the conductor into the uext tauk, where it again leaps from the cathode to the anode, and so on. Upon each anode, which is an immense flat plate, is affixed a thin sheet of pure copper, to start the deposit, while huge slabs of the impure metal from the smeltiug furnace are attached to the cathodes. As fast as pure copper from the sulphate is deposited on one pole, the liberated acid attacks the slab at the other. By degrees the one mass grows and the other diuinishes. The impurities settle iu the tank as mud, and every so often a uew, clean bath needs to be prepared.

VALUABLE MINING PROPERTY FOR SALE.

A ditch carrying 150 miner's inches of water and ten miles long, through some rich gold placer claims unworked. Three mining claims—gold—with pipes and giant and sluice boxes, all complete for working, will be sold

At Public Auction, on Saturday, Dec. 8, 1894,

On the estate of the late ELLIOTT McKINSTRY, on the banks of the Middle Fork of the American river, 11½ miles east of Auburn, Placer county, Cal., at 1 o'clock, P. M.

The Russell Process.

For information concerning this process for the reduction of ores containing precious metals, and terms of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

TUBBS CORDAGE CO.
(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc. Extra sizes and lengths made to order on short notice

611 and 613 FRONT ST., San Francisco, Cal.

Gold and Silver Mining Claims,

Near Needles and Two R. R. Stations,

FOR SALE OR EXCHANGE.

Mill returns show up to $30 in gold and over $115 in silver per ton. House, materials, tools, etc.; no plant. Sell cheap to close the estate of late owner, or exchange for acreage or city property in South California at $7000. J. B. BAINBRIDGE, 230 West First St., Los Angeles, Cal.

California Inventors Should consult DEWEY & CO. AMERICAN and FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. No. 220 Market St., San Francisco, Cal.

NEW METHODS. STORAGE BATTERIES. NEW RESULTS.
THE HOUGH STORAGE BATTERY opens a new era in electrical development. We are now prepared to fill orders for complete plants for lighting or power. Residence lighting now an economical success. Stores, warehouses, mines, mills or street railways at reduced prices. Estimates furnished. Correspondence solicited.
EUREKA ELECTRIC CO.,
42 SPEAR STREET..... .....SAN FRANCISCO, CAL.

Practical Information.

Preventing Fly-Wheel Accidents.

An accident which is occasionally reported from cottou and rolling mills and other factories, but is of more frequent occurrence iu electric lighting and power plants, is the explosion of fly-wheels. For this reason, and also because the immediate effects of such disasters are liable to be felt outside as well as inside of the latter class of establishments, engineering experts have recently been discussing in the pages of *The Electrical World* the superinducing causes of the catastrophes in question. One authority, T. C. Coykendall, traces the trouble to the sudden imposition of a heavy load on a wheel, which already has great momentum; others blame the pattern and construction of the fly-wheel itself; aud others offer still different explanations. The weight of opinion, however, seems to hold the engine-governor responsible for most of the explosions, and to make the latter a result of a sudden lowering or cessation of load. In manufacturing establishments the variations in the consumption of power from one minute to the next are trifling compared with those in electric plants, especially iu the power houses of a trolley line. The sudden stops and starts of a car, the change of grade, the brief blockades that bring several cars to a standstill and thus lead to au almost simultaneous resumption of headway and other causes, produce a continual fluetuatiou in the consumption of power which is embarrassing. Moreover, there is always a chanee of a short eircuit from a "cross" or a "ground" out on the line, which paralyzes the serviee, and instantly relieves the engine of strain. There is, therefore, a constant jerking and shaking of the governor; and if a key comes out, or a belt slips off the pulley, steam will not be shut off. The engine then goes a-racing, and the speed of the fly-wheel rapidly increases, until the centrifugal force exceeds the cohesion of the material. Hence, Professor R. H. Thurston. of Coruell University, Dr. Charles E. Emery and other experts recommend the use of governors of the best type and frequent inspection thereof.

In this connection it is worth while to mentiou that wrapping the rim with about 100 layers of stout manila paper, haviug glue between them, has been proposed as a safeguard against this class of accidents. Fly-wheels might be made with less metal than usual, where this weight is to be added.

Ball Bearings.

Commenting on the growing introduction of ball bearings, which, as may be remembered, first found praetical use in diminishing the frietion of bicycles, Dr. Coleman Sellers, in a lecture at Stevens Institute a short time ago, pointed out that one of the most notable examples of the use of the balls is to diminish the friction of the collar that sustains the hook of a large crane. Without these balls the difference between the friction of rest and the friction of motion is so great that men are often seriously hurt by endeavoring to turn a load suspended upon the crane hook, which requires a great deal of exertion to start it, and when it does move, goes farther than is intended, often leading to serious accidents. By making the crane hooks with flat washers, between which numerous small balls are placed, resting on hardened surfaces, there seems to be no difference between the friction of rest and the friction of motion, and hooks heavily loaded are turned with remarkable ease, so that the use of balls, distributed over plane surfaces, is quite common, there being no basket or grooves to separate the balls, which latter are allowed to move at their own will in whatever direction they are inclined to go. There is very little literature on the subject, and the theory of ball bearings has not been worked out and published. It may be interesting, however, to know that some experiments have been going ou for some time past in referenee to the size of the balls best suited to the different purposes. In the case of hooks for cranes carryiug about fifty tons, betweeu 250 and 300 tons, each of three-eighths inch diameter, are scattered between the flat plates, with the idea that the more points of contact the longer the belts will last, but some experimeuts are now being tried with balls of different sizes, and motion kept up under loads to determine their durability, with a leaning iu favor of larger balls and fewer of them.

It would appear from the reeent experience with the torpedo boats Cushion and Stiletto in stealing into Newport harbor without being observed, in spite of the fact that officers, forewarned of their approach and armed with the best modern search lights, were statioued at the entrance of the harbor, that a torpedo boat should be reasonably secure agaiust destruction by shot from a naval vessel approached under cover of darkness, where no warning is giveu of its approach and the search light is utilized for illumiuating the whole horizon.

No. 8 ...THE COMET CRUSHER OF

FRASER & CHALMERS is brought again to the FOREGROUND by the decision of the U. S. Supreme Court, May 19, 1894, concluding a long course of litigation between makers of the Gates Crusher and Fraser & Chalmers in favor of Fraser & Chalmers, and all costs and expenses to the makers of the Gates Crushers.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Industrial Occupations.

In the huilding up of the industrial structure of any nation there is a continual series of changes. Industries rise and fall, or are being continually suhdivided. As they are simply the ministers to man's wants, real and fanciful, their complexion and importance are in many instances of a fickle and erratic nature. In these changes we not only note the progress of science, invention and enterprise, hut the special industrial conditions, which are the unerring finger points to needed reform or legislation. What the people of a nation do to earn their hread, to huild up their trade and to furnish the sinews of government, is not only a matter of concern to themselves, but of example or of warning to others. The rise or the fall of this or that industry, the drift of population to the various forms of production, and the effects of these changes on competition and international commerce are among the most valuahle, though too often overlooked factors, in shaping the destiny of nations.

In the character of a nation's industries we have the key to its history, says the *Age of Steel*. Napoleon, in the usual military derision of husiness, satirized the people he failed to conquer as a "nation of shop-keepers." They made steel and wove cotton, perspired at forges and delved in mines, and what came from the anvil, the loom and the mine found their way into every nook of the planet and crowded the seas with commercial navies.

The axis of empire was in the workshop and the market. So it will ever he. The greatest nation will always be the husiest. In this lies the vital secret of the highest statesmanship. In the change of industries we see the inevitahle with nations as with trade. As a study and illustration of this fact, we note an ahle review of the industrial situation in Great Britain in a recent numher of the *Free Review*. In a general classification of occupations for ten years the following tahle is of significance and interest:

	1881.	1891.
Professional	647,075	926,132
Domestic	1,803,810	1,900,328
Commercial	980,128	1,339,735
Agricultural (and fishing)	1,313,184	1,336,945
Industrial	3,373,367	7,336,344

In the marked decline in the numher of purely agricultural laborers, which fell from 870,798 in 1881 to 780,807 in the last census year, we see the results of falling prices in home products, owing to the competition of America and other countries in the grain and cattle markets. In the machinery and tool-making trades, ship-huilding and other equipments of transportation, there has been a great growth during forty years, the last decennial period showing an increase of over twenty-seven per cent. Again, the *Age of Steel* says that the persons engaged in the iron and steel trades advanced from 361,343 in 1881 to 380,193 in 1891, the increase, however, being below that of the population. In the coal-mining industries there has heen a remarkable increase in the number of miners, rising from 381,963 in 1881 to 517,110 in 1891, it heing somewhat strange on the surface that, while the numher of miners increased thirty-five and one-half per cent, the output of coal increased only twenty per cent. In the cotton and woolen industries, though, the output has made a marvelous increase; the proportion of lahor engaged is continually diminishing. In the furnishing trades, china, earthenware and glass manufactures, the workers have kept pace with the growth of population. In the manufacture of electrical apparatus, gas, watches, printing and hicycles, and in industries, whether machine or handwork, which supply some luxury or some peculiarly modern want, there has heen a rapid expansion of employment. In Great Britain, as in the United States, merchants, hrokers, agents, commercial clerks, speculators, bankers and insurance agents show a phenomenal increase. Men engaged in furnishing professional and personal services increase much more rapidly than those engaged in producing and distrihuting more substantial factors of material wealth. The richer a nation, the more its demands for luxurious service. Is this the initial of decay?

MINE BELL SIGNALS.
Adopted, Used and In Force in Accordance with State Law.
FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN LEGAL SIZE, 12 X 36 INCHES, THE MINE BELL SIGNALS AND RULES PROVIDED FOR IN the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We can furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market Street, San Francisco, Cal.

The Miners' Convention.

(*Continued from page 340.*)

MR. CAMINETTI: We succeeded in getting $100,000 put into the bill, and at the end the question was asked: "Let us see that bill that the California Legislature passed. Can we get $100,000 from the California Legislature to add to this $100,000?" Under the law as it then stood of course that could not be answered in the affirmative. I really believe that at the time Senator White secured that action of the Committee on Mines and Mining, that if the Senate had had the authority to say from the Legislature of California that $100,000 could have been had to add to the $100,000 asked of the two Houses of Congress, that we would have passed that appropriation. I hope you will not meet that condition again, but that you will get the $250,000 to put side by side with the appropriation of this State, which the Legislature so munificently voted. If, however, you can only get $100,000 or $50,000, as the case might be, it might be well to provide that in case Congress appropriated the last amount, that a like amount be appropriated to the Debris Commission. I think a great deal of good might come from that, and I see no objection to it. Provided you cannot get the whole $250,000, then come down in case it is necessary.

MR. SHERWOOD: We cannot use a dollar until we get $250,000 appropriated by the general Government. We cannot use a dollar of the $250,000 provided for in the Act of the Legislature of California. I want to say this, and I think I can say it with some sort of safety, that the engineers of the Government have been getting points as to the necessity of building a restraining dam at Deguerre Point that has been reported on by three different engineers. The only question that has arisen with this gentleman and the other gentleman who has represented us was, "How much can we get?" You cannot get anything if you do not get a starting point. If you have a limit that you cannot take anything without you get your $250,000 from the Government, and $250,000 from the State of California, you are still waiting. I want this convention to say that whenever the United States Government will appropriate $50,000, or by act of the Secretary of War will authorize work to be commenced on Deguerre Point or any other point suggested, that the State of California, by its Commissioner, shall be authorized to appropriate the same amount of money, whether it be $250,000 or $50,000. My amendment is a less amount.

MR. KELLOGG (of Plumas): The $250,000 appropriation will not lapse until some time next spring, and therefore it will be impossible to change the present law now to act with the present Congress, and if we send a resolution in March next showing that California appropriates $250,000, we hope that we will get it.

MR. SHERWOOD: I want this Legislature that is elected in California now to provide in the bill that if a less amount than $250,000 be appropriated, whether it be $50,000 or $250,000, to be used in connection with the Commissioners, this shall be provided for the State of California.

MR. SEARLES: It may be very well to say that we are in favor of the passage of a law by the Legislature of this State to appropriate $250,000 to be expended in a given manner when the Government of the United States shall have appropriated the like sum. I am not finding fault with the idea advanced here, but with the manner in which it is stated. I say it is neither English nor sense, and it meets nothing.

MR. F. R. WEHE (of Sierra): There seems to be a sentiment in favor of this resolution, and I move that it be referred to the Committee on Resolutions, to be reported back in accordance with its views.

The question was then put on the amendment offered by Mr. Sherwood of Yuba, and the amendment was lost by an unanimous vote.

Mr. Filcher of Placer then extended an invitation to the Association while in the city to visit the rooms of the State Board of Trade, where all the industries of the State are represented' and where each and all are cordially invited to call.

THIRD DAY'S SESSION.

The third day's session of the convention commenced at 9 A. M. on Wednesday. The Committee on Legislation, through its chairman, Mr. Tirey L. Ford, here presented its report, which was prefaced by the following remarks by Mr. Ford:

"In presenting the report of the Committee on Legislation, I wish to say that we found a great many things to look into. There were representatives on the committee from adjoining States, such as Washington and Nevada, and there were many things besides hydraulic mining that engaged our attention. The committee came to the conclusion that it was wise to make as few changes as possible, consistent with the mining interests in the West. The time, doubtless, will come in the near future when a complete revision of the mining laws will be necessary, and the enactment of a new code of mining laws in the United States will be made. That time has not yet arrived, however, and the committee did not deem it wise to deviate any further from the old law than seems to be absolutely necessary to subserve the mining industries of this country. I might say that these changes conform very nearly to the so-called Newland's Bill introduced in Congress by Mr. Newlands of Nevada, which bill was drafted here and sent to him, and it is drawn on those lines."

Mr. Ford read the report of the committee, and on motion of Judge E. A. Belcher of San Francisco, the report of the committee as read was unanimously adopted. The report was published in the PRESS last week.

Mr. Tozier of Nevada then made the following remarks: "I have listened to the reading of several reports made by your respective committees, and I have failed to hear anything on the subject of the Nicaragua Canal. I have this morning hastily prepared the following resolutions which I ask to read, because my hand is now somewhat shaky, although my head is clear and my heart is upon the questions that affect the welfare of the mining and agricultural industries of this State, I being at the present moment a member of both those organizations. I shall read the resolution and ask and urge its passage, and ask other gentlemen to do the same:

WHEREAS, The early completion of the Nicaragua Canal under the auspices of the Government of the United States, substantially as provided for by the so-called Morgan Bill now pending before Congress, is a measure of very great importance to all the industries of the country, and especially so to the Pacific Coast States and Territories; therefore, be it

Resolved, That our State Legislature and our Federal Congress be memorialized and requested urgently to use their best efforts to secure the earliest possible enactment of laws to enable and secure the early building of said Nicaragua Canal.

Upon motion of Mr. Voorhies of Amador, the resolution was, after being seconded, carried unanimously.

The chair announced that he understood the Committee on Legislation to be a permanent committee. Mr. Ford, the chairman of said committee, then stated that he did not so understand it; that the previous committee had acted but one session, and that he supposed it would be the same this session. The chair announced he believed that committee to be composed of the very ablest men of the Association, and thought that the committee could be continued permanently to the very good advantage of the Association. On motion of Mr. Fulweiler of Nevada county, which motion was duly seconded, it was unanimously carried that the Committee on Legislation be a permanent one to act for the Association until its next session.

Mr. Fulweiler of Nevada then offered the following resolution:

Resolved, That a committee of five members of this Association be appointed by the Chair for the purpose of formulating a plan for the establishing of a miners' exchange or bureau, said plan to be reported to the Executive Committee at least sixty days before the next annual meeting of this association.

Resolution was signed by three members of the convention.

Mr. Fulweiler then made the following remarks on said resolution: The resolution as presented to the Association is simply a means of following up the suggestion presented to this convention yesterday by the Hon. C. W. Cross. It is of course general in its nature, so far as the resolution is concerned, but its object and purpose is to form an association with a head here in the city of San Francisco and branches in every county in the State, if necessary, from and through which information may be gained to the end that those desiring to engage in mining enterprises and invest their money in the purchase of mining property, or to loan money or otherwise on mining engagements, can receive information sufficient to justify them in the investment of their money, their enterprise and industry. The object I have in view is much broader than the one here presented. Another gentleman thought it better to present the resolution which I have presented rather than the one I am in favor of, which would be the establishment of a miners' savings bank, in which miners would take stock and invest their money, and in which all miners would deposit their savings; the moneys deposited in that bank to be loaned upon mining property, and to be used in the development of mining property, and not for farms or real estate; to have experts examine all mining property in this State, so that a man could go there and ascertain that property, and there would be no middleman to charge for examining the property. It would be a bureau. If it was a bank, as I suggest, it would be to keep the run of the titles to all property, and therefore foreign enterprises could go to that institution and get any information, reliable and honest, upon which they could get this information. I agree to this proposition, however, stated in the resolution because it is only a step toward the accomplishment of that purpose; but I tell you, fellow miners, that you must depend upon yourselves and put your money where you can handle it and where it will benefit your old home, your firesides and your property.

On motion, duly seconded, the resolution was carried.

THE PRESIDENT: We have with us this morning, by invitation, a gentleman recently elected to Congress, who has been invited to address this Association. He is an able gentleman, a flowery speaker, and I think a true American. I call upon the Honorable Grove L. Johnson, Congressman-elect of the Second District.

Mr. Johnson came forward, was introduced by the president, and made the following remarks:

Mr. President: Unlike my friend Fulweiler from Placer county, I am not a miner. I never have been a miner, but if the Lord gives me life, and I think he will, I expect to represent the counties of the State of California in the Second Congressional District, in which most of the mining in this State is carried on. If I live I also expect to represent a portion of the State in which farming is carried on. I will therefore represent both interests. Knowing you, and you knowing me, I desire to say to you as friends, as one man to another, that if I am spared, and am able to take my seat in Congress, to which your kindness has elevated me, that whatever I can do honorably and legitimately to advance the interests of the miners of this State will be cheerfully and heartily done. I am heartily and thoroughly in favor of the National Government taking hold of this matter and assisting the hydraulic miner of California and enabling him to resume his business. I believe the National Government will do it.

During the campaign which has just closed I so stated to the people of the Second Congressional District. I meant what I said then, and I mean it now. I care not what course others may take I care not what resolutions may be adopted here or elsewhere. I care not what fear other people may have with reference to the matter. For one, I meant what I said during the campaign, and I mean it now, that if I live to reach Congress I shall labor to have the National Government take hold of this matter. I am willing to work untiringly and unceasingly to support the resolutions adopted by this Association last evening, to obtain anywhere from a million to thirty thousand dollars from the National Government to enable this work to be carried on. I think it is proper. I read in this morning's papers that my neighbors think it is not proper. I disagree with them. I recognize those persons as men interested in the Second District and in the State, but their views of governmental policy differ from my own. I recognize this Government as one for the benefit of all. I believe the National Government made an implied contract with the miner when they sold him his land that he should be permitted to carry on mining. If from the decree of the court it should be thought I to turn out that mining cannot be carried on without injury to the people of the valley, and therefore the decree has gone out, as being enforced, that mining of that character shall not be carried on, I believe it to be the duty of the National Government to come to the rescue of the miner, with whom it has made this implied contract, and enable him to benefit himself in the way he has benefited the State and the whole world.

I am glad to be with you to-day. There has also been published the resolution or address of another association which seems to antagonize your movement, and I desire that no misunderstanding shall exist as to my views, of however little weight they might be. I desire the people of the valleys and of the mountains, of the farm and of the mines, to understand that I meant what I said after election as well as before, and that after election I endorsed the views that I expressed before election.

As to the other matters contained in the resolutions adopted by this Association—for instance the matters contained in the report of your Committee on Legislation—I frankly confess to you that I am unable at the present time to give any opinion on. I have not examined sufficiently into them to enable me to say at the present time whether they should be changed in any particular. If these matters come before me, either as an individual or as an officeholder, I can only say that I will look into them thoroughly and will weigh all the arguments, pro and con, and will do all in my judgment that I think is right between all the people of this State.

As I said, I am not thoroughly conversant with those matters. I can only repeat what I said before, that whatever I can do to advantage the miner, whatever I can do legitimately and properly to enable him to obtain title to his mines without owners' conditions and without burdensome legislation, I will do, in season and out of season. I do not understand these matters sufficiently to say now that all the matters contained in your propositions are correct or that all of them need to be supported by this Association or by any person who may represent the people at the national capital.

I rejoice at this convention and the spirit which governs it. Two years ago this Miners' Convention met in this hall, and the same man was chairman then who is now chairman, and long may he live to be the chairman of miners' conventions and to greet us all as friends. In that convention I had the honor to make some remarks and to say to the people then represented that although I lived in the valley, I believed in the cessation of hostilities. I believe that the farmer and the miner should work together. I believed then and I believe now that it is a libel on the intelligence and the inventive genius of the American people for any man, or any convention, or any newspaper, or any lawyer to say that there is no way out of the difficulty. And when any man attempts to say that this mining question cannot be solved, or any man attempts to say that it is utterly impossible to carry on mining in this State without injury to the people, or without injury to the valley, in my judgment he insults the intelligence of the American people. I have faith in the people. I have faith in their learning. I have faith in their abilities. It only needs for us to pull together. It only needs for the miner and the farmer to realize that their interests are identical. It only needs for us to look at the matter in a broad, liberal view and then we can succeed. And I, living in the valley, representing in part the people of the valley and all my interest in the valley, say to you as one man, knowing what has been done in the past and knowing what is being done in the present, that I believe that there is an engineer somewhere—I don't know where—that there is a man somewhere—I don't know who he may be—who will solve this question; and if the means already suggested are not adopted or sufficient, that other means will be suggested and that other means will be adopted, and that final success will reach both parties. What benefits the miner benefits the farmer, and what benefits the farmer benefits the miner. I am not interested in farming and I do not know much about it. It frequently costs a miner $1.10 for every dollar he extracts from the mine, and in that case it is a benefit to the nation and the State, whether the miner gets the money or not. He puts the money into circulation, however. Therefore, as a selfish people, we are interested in it. Of course we do not want the mountains to come down on us in a sudden way and get entire control over us, as it has in the past, when we fight against it; but if it can be brought down in such a manner as suggested by my friend Rose, I will be glad of it. I am glad I have read Mr. Rose's speech, and I wish I had heard it. I believe that is a matter that should be examined into, and I believe the Government should give its attention to it. It seems to me that if that proposition were properly worked out it will be the solution of the problem. If that can be done, it resolves itself down to the proposition of how much money the national Congress will appropriate for that purpose; and they will give it to us.

I desire to say, in conclusion, that I do not want anybody to misunderstand me, and I beg pardon if I speak much about myself, for, as you know, the district which I have been elected to represent in the approaching Congress contains, as I said before, nearly all the mining counties of the State. I live in California and I live in the valley, and I told the people in the Second Congressional district, both in the mountains and the valley, that if I was elected to Congress I would labor for the miners and I would labor for the farmers; and I pledged myself then and there to labor for Government and to the miner. And by the blessing of God I will keep my promise that I made to the people.

THE PRESIDENT: We have in this hall a distinguished gentleman of California, now doubly so by recent events. I allude to the Hon. Jas. H. Budd. Budd then addressed the Association as follows:

Gentlemen of the Association: I am not able, my friends, to enter into any discussion of the matters that have occupied your time and consideration. I desired to be here during the first day of the meeting, but was confined to the house by the orders of my physician. I went out to the sea to visit the next Mayor of this great city. While there I made a few remarks, and the result of that visit was that the doctor told me I would not be next Governor of California, if I did not remain in the house and in bed for the next two or three days.

As to the matters which you are deliberating, you have my utmost sympathy, and any proper measure in the line of your deliberations that may come before me as Governor, will not only have my approval, but when it is in the House and in the Senate, it will have my energetic and hearty support.

This is not mere talk. You of the old Second Congressional District will remember, that when in Congress representing that district, I recognized the duty of the national government to put all of the energetic power of the Government, all of its engineering ability and all the treasure necessary, into the endeavor to reconcile the antagonisms between the two interests. In that behalf, Mr. Chairman, I introduced a bill appropriating the sum of $500,000, which bill did not pass, because, I might say, it had not the united support of the State of California.

During my canvass for Congress some years ago, and during my recent canvass for Governor, I stated to the people that the national faith was pledged to both these interests. It was pledged to the miner and it was pledged to the farmer; to the miner who entered upon his claim under a patent which authorized him to work for the

gold; to the farmer that tilled his land and felt that the Government having given its encouragement to him, it was its absolute duty to see that those two absolute industries were carried on side by side.

As my friend Johnson said, a man should be in an insane asylum who will not recognize that engineering skill, properly backed by the Federal Government, will show that mining is properly carried on as in the past, without injury to the industries of the valley.

Whatever you may do in this behalf will meet with my hearty co-operation. I do not believe there is any real antagonism between the two elements. I am a farmer myself upon the rivers, with lands that are frequently overflowed. I think it is the duty of the Governor of the State to do what he can in the interests of both.

I am sure that California is to-day in a more prosperous condition than it has been in the past. In traveling through the old Second Congressional District, I find more old mines re-established and being put in operation than there were before, and I find that the homes that were desolate in the past are beginning to blossom, and I believe the faces that were so long in the past are to-day smiling.

MR. LANE (of Calaveras): I have a resolution here which I wish the Secretary would read.

The resolution was then read by the Secretary as follows:

Resolved, That the California delegation to Congress he requested to take the necessary steps to organize the Senators and Congressmen from the mining States and Territories into an association for the protection of mining interests in Congress.

The resolution was referred to the appropriate committee.

The afternoon session was held in Pioneer hall at two o'clock.

The Committee on Resolutions, to whom was referred the resolution offered hy Mr. Lane of Calaveras, reported, recommending the following suhstitute for the resolution:

The Committee on Resolutions recommeud that the representatives of California in the National Congress be requested to take such steps as may he deemed proper to organize so that they can work as a unit on legislation affecting mining matters in the Congress of the United States.

On motion of Judge E. A. Belcher, of San Francisco, which was duly seconded, the substitute offered by the Committee on Resolutions was unanimously adopted.

The president then announced that the next order of business would be the reading of a paper hy Mr. Crawford, State Mineralogist.

THE PRESIDENT: I will call on Senator Campbell of Siskiyou. He has a paper which he will read to us on the subject of "Hydraulic Mining hy the Elevator Process." [This is given in another column.]

The president then announced the appointment of the following members at large of the Executive Committee: Charles G. Yale, C. W. Cross, H. Pichoir, Thos. R. Church, A. Carrigan, A. L. Scott, S. B. Christy, R. McMurray, Edward Coleman, E. C. Loftus, A. H. Ricketts, J. J. Crawford, W. W. Montague, Tirey L. Ford and S. K. Thoruton.

MR. BUSH (of Shasta): I desire to ask if there was not a resolution passed hy this Association in regard to the opening of the Sacramento river from the town of Red Bluff to the town of Redding? The resolution was presented in good faith, aud it should obtain your favorahle action when you go home.

THE PRESIDENT: I will say that Judge Bush has stated the fact, and that Redding can he made the head of navigation of the Sacramento river, and I hope that your representatives in Congress will take action on that point.

MR. ————: I notice that the Anti-Debris Convention which was in session at Sacramento, declares itself hostile to auything this convention shall do. I would suggest that the Executive Committee of this Association appoint a committee of three from each local county organization to assist the members, both in the House and in the Senate (at the time this matter comes up in the Legislature) in pushing it to the front. I move that the Executive Committee of this Association ask the county association to appoint a committee of three of their several associations to go to Sacramento during the session of the Legislature and urge the passage of such matters as redound to the success of hydraulic mining.

MR. REARDEN (of Calaveras): I think that is a proper matter to go to a Committee on Resolutions, and I make that point of order.

THE CHAIRMAN: It is on the form of a motion, and uot a resolution, and the poiut of order is not well taken.

On motion, duly seconded, the motion was unanimously carried.

THE PRESIDENT: Gentlemen, we have with us a man who carried on the Pony Express across the continent, and I call upon Col. Majors.

Col. Majors was introduced by the president, when he made the following remarks:

Mr. Chairman and Gentlemen: You have already been informed I am one of the company that ran the Pony Express to this country in 1860. The distance of 2,000 miles was made in ten days and nights, without a single failure having occurred in the entire time of the twelve months that the Pony Express run from St. Joseph, Mo., to California.

The object of the Pony Express was first suggested to my partner, Mr. Russell, in Washington City, by Senator Gwin, who at that time represented your State in the Senate of the United States. He had been trying to do something for you people in this country in the way of securing a thoroughfare from the East to California. In speaking upon the subject in Congress they would tell him it was impossible to make a direct line from the Eastern States to this country, but that it would have to be a circuitous route by way of Los Angeles, El Paso, Texas, and Fort Smith, upon the Arkansas, to St. Louis, which was in about rainbow shape. Mr. Russell was at that time running the daily stages from St. Joseph, Mo., to Salt Lake City, a distance of 1200 miles. They had organized and built stations at a distance of about 12 miles apart for the entire route. Senator Gwin thought there were no other company or persons in the country so well prepared to carry out that proposition, and he therefore approached us. We thereupon started the Pony Express in order to show the people of the United States that the routes could be traveled winter and summer without any delay from the storms, which they claimed would render it impossible to do so. After that demonstration was made, and satisfied the entire country that such a route was practical at all seasons of the year for operations of that kind, there was a law passed to build the Central and Union Pacific Railroads upon that line. That is the benefit and effect that this or any other portion of the country received from the enterprise called the Pony Express, which was inaugurated for that reason.

When the Pony Express ran through the country and never failed for a single day, through high water or low water, rain or shine, it settled the question. That experiment cost us over $200,000, which was virtually thrown away; but the benefit to the country was worth millions.

Since the advent of the railroads and the telegraph, the enterprises that I used to be so prominently connected with, and the principal conductor of, have passed from view, and my calling being thus entirely "played out" by their improvements and industry, I went into the mining business. If you can ever bring forward a man that is more in sympathy with the mining industries of America than I am, just bring him forward. Overland railroads, Pony Expresses, anything and everything that has been inaugurated in this country, has never done so much for it as the mining industry. There are tens of thousands of miles of railroad running to-day along places that are so precipitous that a grizzly bear would have never dared walk over before, that have been projected and constructed solely through the mining industry. There are to-day thousands of homes between the Missouri river and the Pacific ocean that would not yet have been developed if it had not been for the mining industry. The greatest shame that I could know that could come upon the representatives of the country, from the President down to the Congressmen of the United States, is that they have not appreciated this tremendous industry for the American people.

Gold and silver are to-day the aids of civilization and mining, and you cannot have them without it. Whoever places an embargo upon it, or anything that would be calculated to cripple or retard the mining industry, is opposed to civilization, and to the best interests of our people. I care not whether it is the President of the United States, or Senator, or Congressman, he should be condemned by every intelligent man or woman in the land.

Gentlemen, I was brought to the front of the State of Missouri when it was thought that it was the very verge of civilization; there I was brought up with the bears and the wolves. I recollect that three Frenchmen were the only motive power to carry people across the Missouri river for people coming West.

Nothing ever gave us such energy and such widespread enterprise and such indomitable push forward as the people of the United States had when gold was discovered in California in the winter of 1848. There was a new period then arose in the entire country—not alone in California, or in the adjoining communities to it, but a new era arose in the entire United States of America.

Every man in the entire United States was benefited by that result. I am ashamed of men when I hear them say, "Oh, you are a mining State, you little people out there; you want to control this whole country because you have a few mines." Oh, I am ashamed of such people! Gentlemen, *I am history!* I do not have to ask some newspaper correspondent or some banker in this city or some other man who pretends to be a great economist. I have lived through it.

We want the mining industry encouraged. We want gold and silver, and we want silver remonetized at the rate of sixteen to one; and until that is done, this country must suffer and continue to suffer. Talk about good times as much as you please, or one political party coming into power to make good times, until they repeal or change some of the laws already made, or make better ones in place of them! You will not have permanent prosperity in this country, say what you will.

As I before remarked, I am history. We have had a great flop recently in the election. You let a man lie down on this floor here for two years and he will get very tired of it; and while he may turn over on the other side, it is no better than on the other. That is all there is in this tremendous flop. Not a single issue in this vast change—not one. It is tariff, tariff, tariff, and it will not life you by your neighbors' boots. We must have our mining industry restored in the very fullest sense of the word, and if you gentlemen do not go about it there will be such a dearth of business as you have never seen during your whole lives in this land. Money is going to become more scarce instead of more abundant unless you have some way for the laboring classes to meet the prices that they must meet in order to enable them to live. These men who, at the expense of all the other people in the country undertake to impoverish their neighbors merely to become millionaires, should be ashamed of themselves.

A gentleman met me on the street and said, "Majors, you ought to be a millionaire." He knew what I had gone through in this country. I said, "If I was a millionaire to-day, I would not be one to-morrow." He said, "Why?" I said, "Because I have seen so many people that need a portion of it so much more than I do that I would dispense with a portion of it surely."

Gentlemen, no man in the world can make a million dollars honestly, unless his advantages have been a thousand to one almost of what the ordinary men of the country have—unless he has made it out of a mine. He has robbed nobody if he finds a bonanza, and that is about the only way that a man can become a millionaire and be an honest man.

CLOSING REMARKS OF THE PRESIDENT.

Gentlemen, permit me to congratulate you upon the completion of your lahors at this session. Three years ago, in opening the session of this Association, I stated to you and to the people of California that we were not collected here, nor were we associated together, to formulate any plans that were injurious to our neighhors of the valley. I helieve that that promise has heen faithfully kept and that whatever the results he, the valley will hear me out in that statement. While a few individuals in the valleys may be keeping up their cranky position toward what we deem the hest interests of the State, I am happy to inform you that the majority of the people are with us in this movement. No one will be injnred if your ideas are carried out upon the lines which have heen formulated hy this Association, in which we have the material interests of this State at heart.

The citizens of San Francisco have heen more than kind to us. While the miner in the mountains has been tied up, and his mine has been laid under an injunction for years, poverty has overtaken him and it has heen as much as he was ahle to do to support his family. He therefore did not have the means to come to this city to attend the meetings of the Association, nor was he ahle to contrihute to the expense of holding the same. But the citizens of San Francisco have generously come forward and contrihuted toward the means of helping us to carry on this work.

I say to the citizens and to the business men of San Francisco, and as has heen stated hy your State Mineralogist, the increased output of gold has shown the good results of our lahors.

Much has heen done, and much more will he done. We have enlisted the interest of all to our cause.

The Association then adjourned.

THE miners who were in the city during the convention have returned to their homes very much encouraged hy the attitude of the merchants, manufacturers and hankers of this city toward the mining industry.

THE North San Juan Mining Company has incorporated. Directors—Henry D. Morris, Henry W. Morris, James M. Livingston, Charles Page and R. T. Harding. Capital stock, $500,000.

A Correction.

SAN FRANCISCO, Nov. 27, 1894.

TO THE EDITOR:—I note that your report of my hrief address to the Miners' Convention, given on page 323 of your issue of November 24th makes me say: "I helieve the determination of the Amy case, as expounded by the Supreme Court of the United States, is what the miners want." This is not correct. What I said was: "The decision of the Amy case hy the Supreme Conrt of Montana is one that is fair and just to the miners—to all of them. I believe the determination of the Amy case as expounded hy the Supreme Court of Montana is what the miners want," etc.

I do not desire to discuss this suhject at length now, but will request you to kindly make this correction. JOHN M. WRIGHT.

A Conservative Opinion.

The following is from the Marysville *Democrat:*

While the present law is in force and the general control of hydraulic mining is entrusted to men of known ability and experience, who have been active and efficient, we believe the people are satisfied and will, when opportunity offers, indorse their acts.

The miners in convention Wednesday last unanimously and enthusiastically indorsed the law and acts of the commissioners, expressing entire confidence in Major Heuer, Col. Mendell and Lieut. Benyaurd. That this endorsement meets with general favor and strikes a responsive chord in the hearts of the great mass of people not one well informed person will deny. And why should it not when we look back and survey the history of nearly twenty years of litigation, in the course of which hundreds of thousands of money was taken from the pockets of the taxpayers instead of from the ground, as is now being done under the authority of law and the direction of the commissioners. At the same time there is very little damage being perpetrated to any other industry, in fact, less than prior to the advent of the Commission. And while this is a fact, it seems to us that a larger sum of money is heing appropriated from the treasury of Yuha county in aid of the Anti-Debris Association than is necessary, especially so when that organization by its own acts negatives the work performed hy these men. Let us he consistent and while the United States is endeavoring to help solve this problem and pay the bills do not spurn the proffered hand.

Concentrates.

THE Frisco mine, at Gem, Idaho, has closed down its works.

THE Convex mine, near Perris, Cal., has been bonded for $20,000. A five-stamp mill will be built.

THE mill at Condon Canyon, Lincoln county, Nevada, has closed down. It will be moved to De Lamar.

IT is reported in Angels that the Utica Mining Company has bougbt the Lightner mine, adjoining the Utica.

W. S. STRATTON of Cripple Creek, Col., has invested $171,500 in mining property in that district since Sept. 15th.

REDUCTION WORKS to cost $50,000 are proposed at Oroville, Cal., contingent on a honus from the citizens of that place.

EASTERN MEN will put $300,000 in an electric plant to furnish the mines and smelters of Leadville, Col., witb light and power.

B. DODGE and A. B. Bowman, of Pittsburg, have paid $12,000 for 160 acres of placer ground on Connor Creek, Baker County, Or.

THERE is a new gold find five miles northwest of Waterman, San Bernardino county, whicb leads to the legal revival of the old Grapevine district.

THE Arizona Bureau of Mines is about to purcbase and erect a complete new plant of macbinery for the treatment of gold ores by the stamping-milling process.

MALTMAN & THOMPSON, the reduction works prrprietors, have bought the New York Consolidated Quartz Mine on Mosquito creek, near Nevada City, Cal.

THE Ohio & Mountain Lion mine, near Henley, Siskiyou county, has been sold to Salt Lake men for $50,000. The first payment of $25,000 was made last week.

PITTSBURG MEN own tbe Nortbern Placer mine, fifteen miles from Quincy. A hydraulic permit has heen issued and a large amount of work will he done next season.

C. D. KELLOGG has hought the Butterfly mine, near Quincy, Plumas county. A lake near hy will he utilized as a reservoir for storage and the mill run hy water power.

FROM Mokelumne Hill come reports of old gravel mines being reopened. There are many former claims in that section that under existing circumstances will pay to work.

THE sale of the Con. Wyoming mining ground and improvements to the Champion Mining Co. for $80,000 is a happy solution of a vexed prohlem in continuous mining litigation.

THERE was received at Baker City last week from the Risdon Iron Works a carload of hydraulic pipe for the Elk Creek Mining Company's mines at Susanville, Grant Co., Or.

A COPPER lode, characterized as "a second Silver King," has been discovered near the head of Kettle river, 120 miles northwest of Spokane. The ledge is said to be sixteen feet in width.

IN Linn Co., Oregon, eight quartz mines and a large area of placer ground have heen bonded in Quartzville district by French capitalists. The development work is in charge of W. B. Lawler of Salt Lake.

DURING October over 3,060,000 pounds of ore and 442,000 pounds of concentrates were shipped from Colorado Springs, Col., to the smelters at Argo and Denver. The greater part of it carried heavy in gold and silver.

THE Centennial-Eureka mine (Utah) paid a double dividend of $1 a share—$30,000 in all—on the 15th ult., the third douhle dividend paid in succession, and the sixty-first and sixty-second dividends declared hy the company.

THE Cosmos Gold Mining and Milling Company is a new San Francisco incorporation, Andrew Carrigan, John Landers, W. B. Sharp, John Pew and W. L. Carrigan as shareholders. The capital stock is $500,000, with $125 paid up.

Official Mint Statistics.

R. E. Preston, the Director of the Mint, has submitted to the Secretary of the Treasury his report of the mints and of the United States assay offices for the fiscal year ending June 30, 1894, as follows:

The face value of the gold deposited is stated as $140,942,545; $38,696,951 was of domestic production, $28,000,525 foreign bullion and coin and $3,118,421 old material; $2,093,615 worn and uncurrent United States old coin deposited for recoinage.

The deposits and purchases of silver during the year were in silver dollars, being $29,409,828; $19,770,700 was of domestic production, $1,832,890 foreign bullion and coin, $6,481,404 worn and uncurrent United States coin and the remainder, $605,036, old material.

The amount of silver bullion purchased under the Act of July 14, 1890, was 11,917,659 fine ounces at a cost of $8,715,522, average cost per fine ounce being $0.7313. The total amount of silver purchased under the Act of July 14, 1890, from August 13, 1890—the date the law went into effect—to Nov. 1, 1893—the date of the repeal of the purchasing clause of that Act—was 168,674,882 fine ounces, costing $155,931,002, the average price per fine ounce being $0.9244. The total coinage of silver dollars under the Act of July 14, 1890, to July 1, 1894, was $36,087,943, consuming 27,911,768 fine ounces, which cost $29,110,647. The seigniorage of silver coined under the Act of July 14, 1890, to July 1, 1894, was $6,977,296. From July 1, 1894, to November 1, 1894, $2,443,200 were coined. The seigniorage of the same was $786,764.27, making the total amount of silver dollars coined under the Act of July 14, 1890, $38,531,143, and the total seigniorage, $7,766,060.

The total coinage during the year was: Gold, $99,474,912.50; silver dollars, $758,000; subsidiary silver, $6,024,140.30; minor coins, $716,919.26; total, $106,216,730.06. The gold coinage for the year was the largest ever executed at the mints of the United States in any one year.

The highest price of silver during the year was $0.7645 and the lowest $0.5918, showing a fluctuation of $0.1725 per fine ounce. The net gold exports for the fiscal year were $4,172,665, as against $86,897,275 for the prior fiscal year. The net exports of silver for the fiscal year were $31,041,359, as against $7,653,813 for the fiscal year 1893.

The Director estimates the value of the gold used in the industrial arts in the United States during the calendar year 1893 at $12,523,528, and silver at $9,534,277. Of the gold, $8,354,482, and of the silver $6,570,730 was new bullion. The estimated metallic stock of coin and bullion in the United States on July 1, 1894, was: Gold, $627,293,201; silver, $624,347,757; a total of $5,251,840,958.

The production of gold and silver in the United States during the calendar year was: Gold, 1,739,323 fine ounces of the value of $35,955,000; silver, 60,000,000 fine ounces, the commercial value of the same being $46,800,000, and the coining value $77,576,000. Revised estimates of the world's production of metals for the calendar year 1893 shows the same to have been $157,228,100 in gold and $209,165,000 in silver. The world's coinage for the calendar year 1893 is stated to have been $232,485,668 in gold and $135,386,754 in silver.

The Director estimates the stock of gold in the world at the end of 1893 for money purposes to have been $3,965,900,000, and silver, $4,055,700,000; a total metallic stock in the world of $8,021,600,000.

The Banner Mine's Electric Power.

There has recently been installed at the Banner mine near Oroville, Butte Co., Cal., an electric power transmission plant for operating the machinery of the mine and mill. The plant is of 160 H. P., and the power is transmitted two miles from the location of the water power to the mine. In addition to operating the machinery, lights have been installed in the mine, the hoisting works and the mill. The plant has been in operation some months, and that it has been successful is indicated by the following letter from the manager:

OROVILLE, CAL., Oct. 26, 1894.

Thomas Addison, Esq., Manager General Electric Company, San Francisco, Cal.—MY DEAR SIR: I take great pleasure in stating that the electric power plant installed by your company at the Banner mine, for operating the mill, rock breaker, lighting system, air compressor and the pumps on the 300 and 500 levels, works perfectly and to our entire satisfaction.

I take advantage of this opportunity to acknowledge with thanks the constant courtesy, vigilance and ability of your representatives, and to congratulate both you and them on the successful installation of the electric plant in the face of natural obstacles and mechanical difficulties that were seemingly insurmountable. I am very truly yours,

FRANK MCLAUGHLIN, Manager.

HACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes), $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

List of U. S. Patents for Pacific Coast Inventors.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GARDEN IMPLEMENT.—Charles G. Mortensen, Lorin, Cal. No. 529,562. Dated Nov. 20, 1894. The object of this invention is to provide a single implement which is adapted for nearly or quite all the purposes for which it is desirable about gardens and lawns, and an easy means for transforming it into either of its capacities.

It consists of a handle, a flat blade, pointed at one end, pivoted to the handle and turnable about its pivot points to occupy different positions with relation to the handle, a bracing and locking latch whereby the handle and blade are retained in position with relation to each other, a supplemental removable weed pulling attachment, consisting of a bifurcated point adapted to fit the point of the implement having a curved arm extending from its inner edge and latching in a hole in the plate, said arm forming a fulcrum to rest upon the ground when the bifurcated point has been engaged with the root or weed to be extracted. The device may be used in its various capacities as a weed cutter, scuffle hoe or for working in small places in and around flowers.

MACHINE FOR STRETCHING BAND SAWS.—Wm. Hollingsworth and Joseph Korbel, San Francisco. No. 529,551. Dated Nov. 20, 1894. The object of this invention is to provide a device for stretching hand saws as may be needed from time to time. These saws, while at work, are apt to become stretched or elongated, especially upon the front or cutting edge, while the remaining and central portion of the saw, in particular, not being correspondingly stretched, strains come upon it which prevent its working satisfactorily. It is, therefore, necessary to equalize the strains and pressure, which is sometimes done by hammering, sometimes by means of rollers which act to stretch it in lines extending longitudinally of the saw and without reference to the points which may or may not need it. This is apt to cause the saw to buckle or to bulge upon one side or the other. By the present invention the saw is stretched by compression at a great number of points or centers, so that there is practically an outward pressure or tension from all these centers while the intermediate lines of metal remain in a natural condition and act as ties to draw the parts together against outward pressure. The device consists of rollers mounted upon arbors and having alternately crowned and depressed surfaces which meet each other upon opposite sides of the saw blade when the latter is passed between them, and mechanism whereby the rollers are rotated in opposition to each other, with elastic feed disks adapted to grasp and advance the saw.

SEWING MACHINE NEEDLE THREADER.—Patrick Bralley, Oakland, Cal. No. 529,586. Dated Nov. 20, 1894. The object of this invention is to provide a device which is adjustable with relation to the needle and needle bar or hinge so that it may be turned up out of the way when not in use, and readily turned down to clasp the needle, when needed, having a hole through it which exactly coincides with the eye of the needle, and serves as a guide to direct the thread through the eye, the device being made in two separable parts which will open automatically by a little pull to allow the device to be moved away, leaving the needle and thread in position for use.

LIGHTING OR EXTINGUISHING STREET LAMPS.—C. Keweil, San Francisco. No. 529,449. Dated Nov. 20, 1894. This invention is designed to be employed in the lighting and extinguishing of street lamps in a series without the expenditure of time necessary to attend to each lamp separately. It consists of a rod slidable longitudinally through a conduit and connected with a crank arm adjacent to each lamp, said crank arm operating to turn a cock by which the gas is turned to full head when the lamp is fully lighted or turned down so that a very minute flame is left burning. This flame is protected by an enclosing shell so that it is not seen when turned down, and is not easily extinguished by the wind or otherwise.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Notice of Assessment.

NOTICE OF ASSESSMENT.—OCCIDENTAL CONSOLIDATED Mining Company: location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey Co., Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the first day of November, 1894, an assessment, No. 17, of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the fourth day of December, 1894, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office, room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Notice of Assessment.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 26th day of October, 1894, an assessment, No. 1, of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 56, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3d day of December, 1894, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the 27th day of December, 1894, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, 309 Montgomery St., Room 56, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from G. H. Pease and J. B. Colwell in the North River mine, near Yankee Jims, Placer county, Cal., to impound tailings behind dam in Mexican Gulch; and from the Crown Point Mining Co., in their mine in the Tp. of Goodwin, Plumas county, Cal., to impound tailings behind log and brush dam in Porter Ravine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Dec. 17, 1894, at 1:30 P. M.

SITUATION WANTED BY ENGINEER AND machinist who understands the running and care of electric plants. Engagement preferred with parties interested in the use of electricity for the reduction of refractory ores. WM. H. RUE, 242½ 12th St., San Francisco, Cal.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 23. SAN FRANCISCO, SATURDAY, DECEMBER 8, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

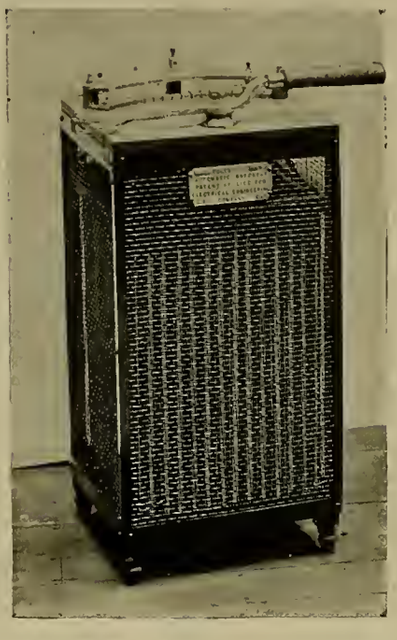
Individual Affidavit Required.

Regarding the attempted issuance of mineral land patents to the railroad, R. M. Veatch, the local land office register, says: "Any person wishing to make an affidavit for protest against the issuance of patent to the Oregon & California R. R. Co. for lands it has applied for, on account of its mineral character, can make the affidavit before any officer qualified to administer oaths; but if the affidavit should be used as a basis for contest, we would suggest that it would be better to have them made before some officer using a seal. We have no form of affidavit, but it simply should contain all the facts as to the mineral character of the land, and the possession, location, expenditures, etc., if any, and asking that a hearing may be ordered to determine the mineral character of the land, etc."

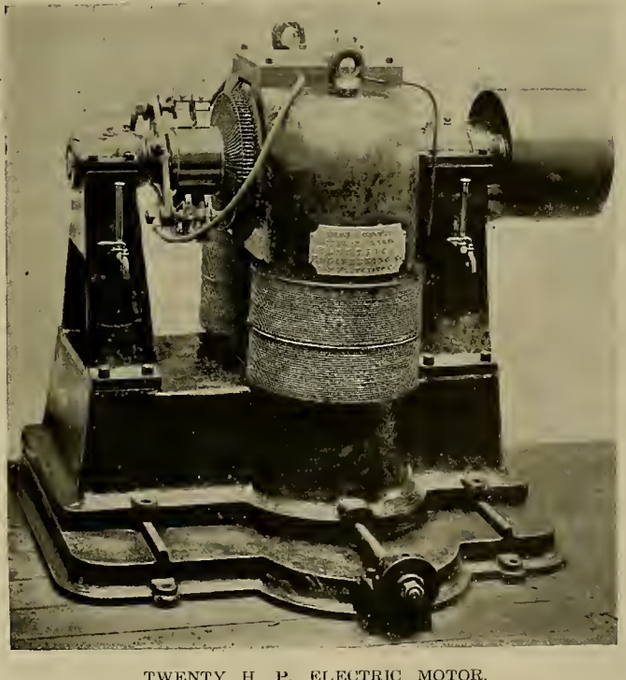
Local Electrical Manufactures.

The lower cut represents one of a series of 20 H. P. electric motors recently manufactured and installed by the Electrical Engineering Co. of 34 and 36 Main St., San Francisco, in Sierra county for mining purposes. Mr. C. B. Sessions, the manager of the company, reports entire satisfaction expressed by the users of those motors.

The other cut represents the Electrical Engineering Company's series non-arcing rheostat for electrical mining hoists. The apparatus is so constructed that the motor is always protected, and at no time permits a greater flow of current to the motor than it is made to safely carry.



RHEOSTAT FOR ELECTRICAL MINE HOIST.



TWENTY H. P. ELECTRIC MOTOR.

A MONAZITE "boom" is reported in North Carolina. It is a rare mineral found in exceedingly small quantities in Finland, Bohemia and Cornwall, with the quality of being apparently indestructible, becoming incandescent when heated to the utmost limit, eagerly sought after by illuminating companies. Grains of brown crystalline sand found in the Appalachian range have been pronounced by experts to be this lonely mineral, and research has uncovered alleged tons of it. At present it is worth $200 a ton, and is being shipped to Germany. North Carolina also reports the finding there of an emerald mine, near Bakersville, Michell Co., from which are now being extracted gems of great value.

ABOUT two months ago J. S. Cahoon of Salt Lake went to the Snake river placers in Idaho with a view of examining the black sand deposits near Almo. He writes that for the first four days he used a pan to find the worth of the placers. The gold was the usual flour gold of that region—difficult gold to save—but he says the four days' service with the pan yielded $27, and that one piece of coarse gold was found in the pan. It weighed thirteen pennyweights, and is estimated to contain $10 in gold.

THE California State Miners' Association has had Mr. Rickett's paper on "Department Rulings and the Miners" published in pamphlet form, and 2000 copies distributed. It was read at the recent Miners' Convention, and attracted considerable attention.

MICHAEL SHUMAN, a well-known mining man, has returned to Spokane, Wash., from his mines in the Okanogan district, and reports the find of a bonanza gold mine at the summit of the Cascade range of mountains, near Slate creek. Two men from Anacortes, named Gerrish and Baron, the finders, are reported by Shuman, after a week's work with the crudest of implements, to have cleaned up $12,000, with plenty more of the same in sight.

BUT three weeks remain for owners of mining claims to file for record notice of intention to hold and work the claim on which no assessment work has been done this year. The provisions of the Act amending Section 2324 of the U. S. Revised Statutes, exempting miners from doing the annual $100 worth of work on the claims, requires that notice of intention to hold and work the claim shall be filed before Jan. 1st, '95.

IN accordance with resolutions passed at the recent Miners' Convention, President J. H. Neff has appointed a committee for the protection of mineral lands from railroad grants, composed of A. H. Ricketts of Alameda, Charles G. Yale of San Francisco, Charles F. Hoffman of Placer, E. C. Loftus of Tuolumne, and J. M. Wright of Alameda. It is the duty of the committee to appear before the Department of the Interior by memorial and by agent, to endeavor to stop the patenting of mineral lands to the subsidized railroads; also, to obtain an order from the Commissioner of the General Land Office that the burden of proof that land claimed as agricultural by the railroads shall be placed on those corporations in accordance with the decision of Justice Field in the Bardon case. Another committee was appointed to consider the establishment of a mining exchange in San Francisco. The committee consists of J. M. Fulweiler of Placer, W. F. Englebright of Nevada, Thomas T. Lane of Calaveras, C. C. Bush of Shasta and L. F. Reichling of Amador.

ON another page appears No. 2 of the "Notes on the Gold-Bearing Black Sands of California," by Mr. J. A. Edman. So much present inquiry is received regarding these sands, their source, probable profit and method of treatment that these papers possess more than ordinary interest, and are a valuable addition to the stock of information regarding this important subject. Mr. Edman, who is a practical man, has given this matter considerable intelligent study, and the result of his present series on gold-bearing sands must be of benefit to all who are in any way interested in this important source of natural wealth.

CONGRESS met for the short term last Monday. As the members elected on the 6th ult. will not take their seats till the 4th of March, '95, it is not probable that the silver question will receive much attention during the present short session. Consideration of that issue will probably be reserved for the long session, making it a question, as it is sure to be, in the presidential campaign of 1896.

BLACK SAND MINING is receiving considerable attention in Del Norte Co. Letters are received from all sections inquiring about the prospect of mining our beaches, the writers having machines they are certain will save the gold.

THE African Gold Recovery Co., which recently announced a reduction of the royalty on their cyanide process, states that during October they had recovered 56,000 ounces of gold at the Randt, and 8700 ounces in other districts, a total of 64,700 ounces. The September total was 62,100 ounces.

THE National Electric Light Association's next convention will be in Cleveland, first week in March '95.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 362-363.

ONE would think, says the Placer *Republican*, that the city of Sacramento would be anxious for the revival of the mining industry of the State, inasmuch as that city is the natural depot of supplies for the mining regions. The miners only ask to be enabled to work their mines after the Government has built such dams as will protect the valleys from injury, and yet we see an organization, styling itself the Anti-Debris Association, meeting in that city and solemnly protesting against the resumption of hydraulic mining under any conditions. We don't believe the association referred to represents the real sentiment of the people of Sacramento upon the subject.

WHILE a decision of the Supreme Court of the United States must always be given respect, and nearly always approval, yet a recent decision by that tribunal does not seem imbued with its usual spirit of equity. It is in effect that any inventor or owner of patent whose invention may be used by the United States Government, without agreement or contract, has no claim against the Government. The case in question involved a claim of $60,000 sued for by reason of the use by a government architect of a patented pavement in the grounds of the National Capitol. If that decision is run out to its logical conclusion, any patent device submitted to government officials can be adopted and used by the Government without any profit to the inventor, even were he in possession of a patent from the Government itself.

IN an address before the Academy of Sciences last Monday night, Mr. Irving M. Scott of the Union Iron Works made timely and appropriate reference to the continued loss this State entails upon itself by hiring other communities to do the work that could and should be done within the borders of the commonwealth of California. He showed that we annually pay nearly $2,000,000 for cars and locomotives, which mainly goes elsewhere—and, incidentally, pay nearly as much more in charity to deserving men who have no work. Other millions in other lines are sent away to the great detriment of the State, thus drained of coin for things that, under better industrial conditions, could be made here. Mr. Scott has earned the right to speak plainly of these things. By the untiring energy of himself and associates, he has shown what California can do in securing contracts for and turning out battle ships, and in this has but given index to what is possible of achievement in the line of manufacturing enterprise in this State and city.

The Debris Commission.

At this week's meeting of the Cal. Debris Commission no permits were issued. It is thought that action will be taken next week on the petition of the Gold Run Hydraulic Mining Co. for permission to construct a rock dam in the North Fork of the American river.

Col. Meudell, Col. W. H. H. Benyaurd, Major Heuer and Lieut. C. E. Gillette, the members of the Commission, have made their second annual report to the Secretary of War, covering the past year's operations and outlining what has been done.

Application was made last April by the Commission for interpretation of the law's intent as to hydraulicking going on without permits. Att'y Gen'l Olney then gave it as his opinion that, waiving the question of the Commission's duty to order the discontinuance of such operations, they were empowered so to do, advising that previous notice be served on the parties violating the statute. Accordingly the owners of eight hydraulic claims were so notified, all promptly ceasing and making applications for permits. Two-thirds of 78 applications made during the year were granted.

For the twelve months ending Sept. 30, '94, the amount of material mined is estimated at 1,500,000 cubic yards; the present available storage provided is estimated at 8,500,000 cubic yards. The report refers to the conditions requisite in the construction of dams to be accepted by the Commission.

Among the requirements as to the storage of detritus are mentioned the character of material, size of mine, its distance from navigable waters, output of other mines in the same drainage basin, quantity of water flowing in that basin and other physical features. If the basin is an old hydraulic bed into which the flow of water is at all times small, any type of dam, while mining is carried on, will be considered efficient. In all other character of mines dams of a more permanent nature are required. A brush or timber dam is not considered permanent except where so situated as to be always kept wet. Such dams have generally been approved for small mines.

Monthly reports are required of each miner holding a permit, and mines are inspected by an executive officer. The inspection and reports relate to effectiveness of the restraining of detritus and include observations of the quantity of soluble material that escapes to water courses. This refers to clays or sand in minute grains. Such material can be stored only in cases where a period of rest can be secured behind barriers.

The report enters at length into a statement of existing conditions, as found by careful observation, and the aims and needs of the commission. The Yuba and Bear rivers are cited as being most seriously affected by the detritus. The report says that the mass of material in the lower end of the Yuba is so great that the present river bed is several feet above the surrounding country. It is confined by levees placed about two miles apart. The mass of detritus at its mouth forms a kind of submerged dam at the mouth of the Feather river, so that at each high water the city of Marysville is seriously threatened with great danger. The navigability of the Feather below the mouth of the Yuba is much impaired by this filling. Conditions similar to the Yuba obtain to a less degree in the Bear. Under these conditions a more thorough impounding of detritus is required for mines draining into these rivers.

Not as much as was desired has been done toward improvement of navigability of rivers, owing to lack of funds. The sum of $20,000 is estimated to be required for surveys that the Commission proposes to further make with a view to the improvement of the rivers. A survey of the Sacramento and Feather rivers is now being made. In Suisun bay it is estimated that, between 1850 and 1878, 407,000,000 cubic yards of detritus were deposited, and about 10,000,000 cubic yards annually from 1878 to 1885 It is estimated that the raise of the river bottom at Sacramento since 1850 has been at least fifteen feet, not less than that at Marysville, and that there must be at least 120,000,000 yards now in the Sacramento and Feather rivers below Marysville. In the opinion of the Commission, these figures indicate that the possibility of filling up Suisun bay and consequent removal of the mouth of the Sacramento and San Joaquin rivers from near Collinsville to near Benicia is a question that must be given serious attention before a definite plan for the cleaning out of the rivers can be formulated. A restraining barrier is reported to be needed in the Yuba at De Guerre Point to retain above it the mass of stone, gravel and sand which is moving down the stream, and which, to a large extent, each year reaches navigable waters. The Yuba river, beginning at De Guerre Point, should be trained and controlled in one channel by the protection of its banks mainly by brush work. The intent of the operations on the Yuba river is to effect control of the river and raise the banks to a height at which willows will grow, they protecting the banks of the river. When this result shall have been secured, large deposits of detritus lying below De Guerre Point, estimated to contain several hundred millions of cubic yards, may be regarded as impounded.

When these operations shall have been carried out, the degree of impounding that is practicable will have been secured and the contribution of detritus to navigable channels will be reduced to a minimum. In the process reached by this method the bed of the river is scoured and the material carried below, and becomes year by year less a danger. The quantity of material brought down by the Yuba cannot now be estimated.

The Commission is of the opinion that the amount of detritus now in the Yuba river from De Guerre point to Marysville is 308,000,000 cubic yards. A rough estimate of the quantity of this material between Smartsville and De Guerre point is made at 100,000,000 cubic yards, making a total of 408,000,000 cubic yards now in that river as the result of the mining of 176,000,000 cubic yards.

During the current year the Commission expects to recommend an appropriation for the restraining of detritus lying in the Bear and American rivers.

The report is a complete and impartial statement of fact, and of great interest to the dwellers in the valleys and foothills alike.

The Wardner Trouble.

The latest phase of the disquietude in Idaho mines is the strike at and consequent shutting down of the Bunker Hill and Sullivan mine, which for the past year has employed about 350 men. The closing down was under the following instructions from this city:

H. W. Bradley, Wardner, Idaho: Owing to the steady decline for months past in the price of silver and lead, giving this company a very small profit at the cost of the rapid exhaustion of its mines, the company has contemplated for some time past the closing of its works, but has hesitated taking such action, hoping for improved prices and disliking to discharge its employes at the beginning of winter. Now that there is no prospect of improved prices and the company is relieved of all responsibility by the action of the miners' union making such demands that to accede thereto would be virtually surrendering the management of its affairs to that association, you are directed to pay off all employes and close operations. N. H. HARRIS, President.

The monthly pay roll was $38,000; of this $30,000 went to underground men. The cessation of all work is a blow to Wardner, which was just getting over the effects of the last big strike.

The miners' union claims that their members were blacklisted, and that Italians, Finlanders and other "outside" men were employed in preference to heads of families resident in Wardner. They demanded: Recognition of the miners' union; that all underground men join the union at once; that some of the men now employed by the company be removed; that there be no discrimination against the men now in the community; that no more men be imported, and that the men now in Wardner be given the preference.

The question of wages does not seem to have entered into the controversy.

WITH few exceptions, the press of the State and coast upholds and endorses the action and sentiments of the recent California Miners' Convention. A few of the valley papers which are in constant opposition to the efforts of the many to promote the general prosperity of the State argue against the proposed aid to build restraining dams, but the great heart of the public beats in sympathy with any and all effort to produce greater yield of that which benefits all alike, when, too, the effort is with careful regard to the rights of all.

WITH this issue is resumed publication of Prof. Hanks' elaborate treatise on Mineral Hydrocarbons.

Concentrates.

THERE are 65 men working at the Pilot Bay, B. C., smelter.

ABOUT ninety men are working the Thistle shaft near Gibsonville, Sierra Co.

W. S. STRATTON'S income from his Cripple Creek mines is estimated at $20,000 a day.

THE Erie, Iowa and Birchville mines, Eureka district, Nevada Co., have started up again.

THE Halsted mine at Spanish Ranch, Plumas Co., is being put in shape for extensive operations.

THE Horsefly hydraulic mine at Cariboo, B. C., is said to show a yield of $13,000 for two weeks' work.

THE Anaconda this year promises to beat its record of 1892, when it produced 100,000,000 pounds of copper.

AINSWORTH, WASH., claims to have enough ore in sight to furnish sufficient ore to run the biggest kind of a smelting plant.

ALL the machinery has been taken out of the underground workings of the Yuba mine at Maybert, Nevada Co.

IT is understood that the Lane-Haywood-Campbell purchases in Silver Bow Basin, Alaska, involve the payment of $500,000.

THE Columbia G. & S. M. Co. at Scott's Bar, has bought the five-stamp mill that was in operation at the California Midwinter Fair.

THE Government has built eight wing dams, at an expense of $15,000, in the Sacramento river, above Freeport, to scour out a channel.

THE Union Mining Co. has bonded the Keystone and Pittsburg mines on North Powder river, eastern Oregon, and is developing them.

J. F. WARDNER has succeeded in interesting Philadelphia capitalists in operating a group of gold-bearing mines near Kennedy, Nev.

ON the co-operative plan at the Morning mine, near Mullan, Idaho, during October the miners thus employed are said to have made $2.68 per day.

AFTER lying idle for about seventeen years, the old Murchie mill, near Nevada City, is being fitted up, and will crush the ore of the Lone Star Co.

THE Helena, Montana, assay office has shipped an average of $250,000 in gold a month for the past five months, an increase of 50 per cent over last year.

THE Columbian mine in the Virtue district, Eastern Oregon, is now declared to show a five-foot ledge, the ore clear across the vein going $200 to the ton.

TO THE Silverton, Col., *Standard* the principal effect of the past election appears to be that mining stocks are going up and miners' wages going down.

THE chlorination furnace for the Jackson-Lakeview mine, Mono Co., is in place, and the rest of the plant will be ready for work by the first of the year.

THAT is a costly shaft now being sunk at the Argonaut mine in Amador Co., the expense being $80 per foot. Ordinarily, it averages from $25 to $30.

CONSIDERABLE work is being done in the six properties in the Rice district, the new gold field at the edge of the desert, east of Warner's ranch, San Diego Co.

THE cinnabar ledge near Tuscarora, Nev., still attracts considerable attention, and were quicksilver worth anything like the prices of former years, would be developed.

THE Syndicate Mining & Smelting Company, J. H. Whalon, president, has incorporated with $100,000 capital stock, to develop its gold properties at Camp Floyd, Utah.

THE headquarters of the State Miners' Association have been removed from the Mills building to the fourth floor of the Stock Exchange building on Pine street, this city.

THE Ashland, Or., Mining Co. is reported in financial trouble. Several of the employes have filed liens. The ledge is rich, but expensive work has made the company short of cash.

FOUR quartz mills are now at work at the junction of Applegate and Williams creek, Oregon. Each with an adjacent mine furnishes employment for from ten to twenty-five men.

THE South Eureka shaft is to be sunk 300 feet deeper, when it is expected developments will justify the erection of a mill. The company has already spent nearly $100,000 developing the property.

THE new compressor of the Centennial-Eureka Mining Co. at Tintic, Utah, will be in running order by the end of this month. Another double dividend of $30,000 has been paid, being $1 per share.

AT Tintic, Utah, the Mammoth mill is working thirty stamps and putting in twenty more. The company will do away with leasing at the mine, and put seventy-five men to work at day's pay.

MANY of the mines of Butte, Montana, are lighted by electricity. In the larger properties independent plants are in operation, while in the smaller ones the current is obtained from the local station.

THE new quicksilver furnace of the Altoona Company at Cinnabar, Shasta Co., has started. The average of the ore is over five per cent in quicksilver. Two other furnaces are to be added in the spring.

THE Hibernia quartz mine at Greenville, Plumas Co., has been bought by Gullic & Co., who are about to put a twenty-stamp mill thereon. They have also secured twelve other locations in that vicinity.

THE property of the Rainbow Mining Company, Nevada Co., has been attached. The men at work say they were unable to get wages due them. The mine is owned in this city. About $5000 is claimed to be due.

THE Wimer claim, near Waldo, Or., includes 230 acres, with 2100 inches of water and 175 feet pressure. It is thought that it will take a century to work all the ground controlled by one of the two cuts in this district.

IMPROVED MACHINERY is to be put on the Bogan silver mine, an extension of the famous Silver King, at Park City, Utah, consisting of an improved thirty-five-horse power double cylinder reversible engine and a 1200-foot cable.

E. J. RADDATZ AND F. DUROY of Mercur, Utah, have bonded their Bonanza group of mines of thirteen claims to Bigdon & Smyth of Colorado, for two years. The purchase price is $100,000. The group is 1¼ miles east of the famous Mercur.

IN Shasta county 120 stamps are reported dropping—30 at Squaw Creek, 20 at the Texas, 10 at Quartz Hill, 20 at Iron Mountain, 10 at the Washington, 5 at the Myers, 10 at the Wheeler, 10 at the Minnesota and 5 more at the Gulch.

THE Black Gold Channel Mining Co., composed of M. Phelps, J. M. Sparkham, M. P. Ward, J. H. Shotwell, Chas. Twombley and S. McLean, all of Seattle, Wash., has paid $16,000 for placer mining property on Foots creek, Josephine Co., Or., and will develop it.

THE California mine, five miles from Hornbrook, Shasta Co., has been bought by four men from Mercur, Utah—Dern, Arris, Brown & Helmrich. It is the freest of gold ore, dissolving in water, and the new purchasers estimate they have half a million in sight.

THE Pichacho placer mines near Yuma have shut down. After a week's run with twenty-three men they cleaned up $30 in gold. Expert Glendenin, who is examining the pumping plant, says the pumps must be moved and changed before they can do good work.

RECENT extended mention was recently made of the "Culoric process" for treating tellurium and pyrites. Major Cooper of Durango, Col., asserts from trial that it is a success, and that at the Philadelphia plant the entire cost of treatment does not exceed $1.20 per ton.

THE Phœnix Reduction Company has rebuilt the Bullionville, Nevada, mill, burned last year, and is about to commence operations, using the cyanide process. The tailings of the old mill will be put through first. This will be the first cyanide mill in southeastern Nevada.

THE Anita G. M. Co. has incorporated with $10,000,000 capital, to work the Bright claim on Shober Hill, Amador Co. The incorporators are: F. Reichling of Oakland, D. E. Hays of Mill Valley, John Barton of Alameda, George Goodman of Oakland and W. E. Davis of San Francisco.

THREE new converters of five tons capacity each, for the expulsion of sulphur from copper ores, are on trial at the Copper Queen Company's works in Bisbee, Arizona. From each charge of molten matter—five tons—there are usually fifteen bars of fine copper weighing 350 pounds each.

THE demands of the Bunker Hill and Sullivan miners at Wardner, Idaho, are that union men be hired and no discrimination in employment of capable miners, those now there to have the preference, and no men to be "imported." Everything has shut down and resumption is indefinite.

IT is rumored in Deadwood, South Dakota, that J. B. Haggin of California, the Swifts of Delaware and the Omaha & Grant Smelting Company have combined and will erect large smelting works at Deadwood, at which place all the ore from the tributary country can be treated at the least cost.

THE *Independent* reports that A. W. Drummond found a nugget of pure gold weighing three pounds last week in Slate gulch, near Big Oak Flat. He dug it out of gravel. There was no quartz attached to it. A piece of nine pounds weight was taken out of the same gulch about thirty-five years ago.

IN the town of Forty Mile Creek, on the Yukon river, Alaska, the largest in the placer gold mining district, flour sells for seventeen cents a pound, bacon brings forty cents, beans are firm at twenty cents, butter is strong at seventy-five cents and dried fruit is worth twenty-five cents a pound.

THE Idaho Gold Mining Co. has incorporated with $150,000 capital at Salt Lake. The president of the company is Ezra Thompson; William A. Wilson is treasurer, and Charles Mador, secretary. The intent is to work the Robinson and Austin mines in Mt. Pisgah mining district, Bingham Co., Idaho.

ACCORDING to reports from the Silver Coppolis mine, fifteen miles from Baker City, Or., there is an unlimited vein of copper ore from six to twenty-five feet, the rock running 20 per cent in copper. The owners, J. C. Taylor and L. W. Clark, expect to get a rate of $6 a ton to the sea, and figure that they have a bonanza.

C. H. HENY, superintendent of the Nevada Southern Railway, and associates have eleven claims at Goldstone, the new camp twenty miles north of Fenner, on the Atlantic & Pacific railway in San Bernardino Co., for which he says they have refused an offer of $60,000 in three equal payments by San Francisco men.

FOR two years the North Fork Company has been putting in 1,000 feet of flume at its mines in Siskiyou county, hydraulicking for bed rock, and now has struck pay dirt which, it is said, goes a dollar to the pan. Nothing can be done this winter, but the owners figure on taking out a thousand dollars a day next spring.

THE mill in Collierville, Calaveras Co., is not running. The proprietors assert that it is a waste of time and precious metal to try and save the gold by mill process. The ore is very refractory. Quartz that yields $35 per ton by mill process, gives returns of $325 per ton at Selby's smelting works in this city. The expense of shipping quartz from the mine here is $35 per ton.

THE announcement that a Boston syndicate was about to open up thirteen large mines at Coulterville, Mariposa county, has caused men to go there in search of work, and they are now lying around the town in idleness, as the mines are not yet in operation and will not be until next spring. It is a good plan for miners and other laboring men not to go to the town, so advises the Stockton *Independent*.

THE annual report of Governor Hughes of Arizona shows for the year an increase of silver product to the amount of $702,000. The increase in gold is $1,078,000 and of copper 9,557,993 pounds. Arizona now ranks third among the States and Territories in copper production, fifth in gold and seventh in silver. The current monthly output of gold indicates that the total product for 1894 will be over $4,000,000.

RETURNED miners from the Western Australia gold fields say Coolgardie, which is 400 miles east of Perth, is reached by mule teams or camels. It contains 6000 people. The water used for drinking and cooking purposes is distilled salt water from salt wells, and is sold for twenty-five cents a gallon. Flour sells for $7.50 a bag, or $15 per 100 pounds. Canned meat is retailed for 65 cents a pound. The surrounding desert is rich in gold, but without water to wash it out of the sand men are working at a great disadvantage. All that a man can do is to pick small pieces of gold out of the earth. He occasionally finds pieces of gold the size of a pea, and once in a while small nuggets of greater size. It is hard work and does not pay. A California dry washer would be a Godsend to many a poor fellow there.

LETTERS in Eastern papers declare that "there is a great gold excitement in the Argentine Republic, and thousands of prospectors are rushing into the Chubut Territory, where, in the opinion of an expert California miner who has explored its mountains and valleys, are the richest gold veins in the world, and more of the yellow metal in sight than the capital and deposits of the Bank of England could pay for. The discoveries are in the foothills of the Andes, near the source of the Rio Negro."

THE Gold Bank, at Forbestown, has increased the capacity of the mill by adding to the weight of the stamps. Of the forty stamps, twenty-five have had their stems lengthened, thereby increasing their weight 400 pounds to the stamp. The other fifteen stamps will be served in a like manner within the next two or three weeks. By this change in the weight of stamps the crushing capacity of the mill is increased about one-fifth, and will work in the neighborhood of 120 tons per day.

THE new leaching plant for the Bimetallic G. & S. M. Co., at Phillipsburg, Montana, can handle 700 tons of roasted tailings or 300 tons of dried tailings every twenty-four hours. The mill was originally a 100-stamp mill, but only the new addition is being used, as no ore is being mined, the property having been closed down last fall on account of the low price of silver. At the Bimetallic mill there are 160,000 tons of tailings, from which the Russell process extracts 75,000 ounces of silver and $3000 in gold per month.

THE United States Supreme Court has issued a writ of certiorari in the case of the Tyler Mining Company against the Last Chance Mining Company of Idaho. This is a point in favor of the latter. The Circuit Court of Appeals in this city decided the suit in favor of the Tyler Company. The writ issued by the Supreme Court lends to a possible reopening of the case. Both mines are situated near Wardner, Idaho, and their value is said to be upward of $2,000,000. The litigation grew out of a conflict of location, one mine lapping the other.

THE Poorman mine is said to have the finest all-round plant in the Cœur d'Alenes. It employs about 200 men in all, and the concentrator handles an avarage of 350 tons every 24 hours. A shaft has been sunk 900 feet. It has great electric pumps on the 600-foot level, and a large compressor for working the air drills. About 400 electrical horse power has been generated from water. The mine is worked in stopes and the upper levels are filled with the refuse of the new work below. The Poorman ships from 1500 to 1800 tons of concentrates each month.

SINCE Sept. 1st, twenty-two buildings, including a twenty-stamp mill, have been built at the English Mountain mine, near Grenitevillo, Nevada Co. About fifty tons of free-milling ore are daily crushed. The ore is carried from the mine by a wire cable, three-fourths of a mile. Buckets are placed upon the cable seventy feet apart, each one holding about 100 pounds of ore, and the mine being about 800 feet higher than the mill, the weight of the full buckets requires a brake to keep them from running too fast. They are partly loaded and wholly emptied automatically.

THE Tolo placer and quartz mining property, near Fort Lane, Oregon, has been sold to Tacoma men for $6000. The mine embraces 160 acres and has been profitably worked by crude methods for the past twenty years. The new company have bought a 150-horse power engine and the other necessary machinery. The water will be pumped from Rogue river and the pressure will be through the force of the engine. They claim that they can force through the pipe 2000 gallons per minute. The cost of the machinery is $7500. It will be placed and ready for operation by January 1.

THE iron mines of Hanover, N. M., are being worked to a higher production than ever before. There has always been vast quantities of the iron ready for extraction, but the demand has never been equal to the supply, nor is it now, as the mines could readily turn out thousands of tons of ore per day. But the demand has increased so that from 150 to 250 tons of iron ore is being shipped daily. Fifty men are employed at the mines breaking the ore, besides the teamsters employed in hauling. The camp is a thriving one, and with increased demand for iron and copper will soon grow to be one of the largest mining camps in the west.

TALKING about the gold output, the Victor, Colorado, *Gold Record* says: "The latest estimate of the production of the district is fixed at forty-six carloads, or 690 tons daily. Placing the value of the ore at $50 per ton, which is a low average estimate, it makes a daily output of $34,500 per day, or $1,035,000 per month; and this without counting the retorts from the stamp mills in the district or from the cyanide and chlorination plants now in operation. It looks as if the district had passed the one-million-dollar mark, and a noticeable increase can be looked for as soon as the low-grade ore commences to move toward the enormous mills being erected at Florence. The regular shippers are the Victor Public Sampling Works, Independence, White House, Strong, Bobtail, Victor, Portland, Caledonia, Dolly Varden, Anaconda, Moose, Raven, Gregory and Elkton. The total product for 1894 will be over $12,000,000."

Personal.

J. B. WHITE has been appointed chief engineer at the W. Y. O. D. mine.

J. G. Bloomer is now with the electrical firm of Holtz & Fey, 39 Stevenson street.

GEO. NIHEL of Nevada City succeeds W. A. Hawley as superintendent of the Brunswick mine, near Grass Valley.

ENSIGN G. H. BURRAGE, U. S. N., has been ordered to the Union Iron Works, as assistant to the Inspector of Electric Lighting.

CAPT. PALMER is announced as the new superintendent of the Boston and Montana Mining Co., to take charge when Capt. Thos. Couch resigns to devote his exclusive attention to the development of the Merced Gold Mining Co.

Notes on the Gold-Bearing Black Sands of California.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by J. A. Edman.

In contradistinction to the heach sands, which represent Nature's concentration on a grand scalc, the stream sands seldom became noted except through man's operations as a gold miner in placer and other gravel deposits, and they have, with few exceptions, generally been regarded as waste products.

Being originally but a small portion of the enormous mountain masses removed by subaerial erosiou and degradation during later geological periods, where the ancient deep gravel deposits were formed and succeeded by those of the present river systems of the Pacific coast, the black sands of California represent the minute forms of the minerals which have hest resisted the action of physical forces, tending to the disruptiou, abrasion and solution of the rocks exposed to their action. By virtue of their density associated with the gold and the platinum metals set free from their matrices by the same agencies, they may justly be said to be hoth gold-hearers and gold-carriers of California's placer mines. First noted as an impediment in the miner's rocker in the early days of river mining, the stream sauds have since then appeared in varying quantities wherever placer mining was prosecuted—in river hars and beds, in creeks, ravines and gulches, in the drift mines of recent and ancient channels, and in the stupendous operations of hydraulic mining. In fact, wherever placer mining became an industry, both in ancient and modern times, the heavy sands were noted, but chiefly for the precious stones they carried, such as the diamond, the ruby, the sapphire and the topaz.

The origin of the stream sands may he traced hoth to the metamorphic and archean crystalline rocks ahounding in California, of which many of its minerals form primary components, and also to the eruptive and volcanic rocks, where they generally occur as secondary products. Even in the tufas and volcanic pipe clays of California many of the most ahundant minerals of the stream sands, such as magnetite, ilmenite and chromite, may he found in abundance and uearly always as alteration products. The zircons are supplied by the granites and syenites, while the garnets are derived from the mica schists, not very prominent in California hut well represented iu British Columbia.

For convenience in description the stream sands will he classified as *original* when obtained from one distinct gravel channel or stream bed, and as *mixed* when collected from miniug debris, such as tailings mingling from different gravel mines as well as from quartz mines. As a rule the greatest variety of minerals is found in the sands obtained from the oldest channels, whose material is chiefly derived from the metamorphic slates and oldest crystalline rocks, where also generally the greatest gold contents are found. The quantity of hlack sands is often determined hy local conditions of gravel deposit, and is not in direct ratio to gold coutents, which is strikingly illustrated in the stream sands from the lava channels, which in character differ much from the above mentioned, being rougher and less worn, often with foreign material adhering to the grains and frequently oxidized and brown in color. The richness of any particular sample of stream sand, when reduced to the proper staudard, is generally determined hy the amount of erosion of the stream where found, the small and shallow ravines furnishing the poorest. With the almost universal distribution of magnetite and titauiferous irou through the gold-bearing rocks of California and the frequency of veins of iron ores, such as hematite and magnetic iron, it can readily be perceived that large quantities of these minerals may be set free even by the ordinary weathering of the rocks at the surface, without heing associated with gold in appreciahle quantities. Many of the dykes of eruptive rocks met with in the gold regions carry, particularly near their walls, much finely disseminated magnetite, practically unaccompanied hy gold. The stream sands may therefore he said to be indicators of gold and not necessarily gold hearers except in instances to he hereafter mentioned, and the greater the variety of their special minerals the hetter the prospect of economic value.

To the geologist and litholgist the study of these sands offers opportunities not to he neglected. Each distinct stream, hoth ancient and recent, carries in its heavy minerals testimony of the rocks through which its channel was cut, and its length and size may often he surmised from the physical coudition of the minute grains of its black sands. The variety and beauty of its microscopic minerals, presenting often sharp, distinct and perfect crystals of varied forms and colors, will interest the general observer, and serve as studies for the petrologist, fully as important and often more satisfactory than rock sections. Taken in conjunction with the heavier gravel, the intelligent miner will find in these sands the means of determining with accuracy the continuity of each distinct channel and trace the entrance of branches into the main streams. Even the proximity of important metal-bearing veins are indicated under the microscope by the presence of minerals peculiar to certain classes of ores, and the presence of one large lode will often he found to influence the character of the stream sands for a mile or more helow its intersection hy the stream.

CHARACTER OF STREAM SANDS.

In addition to the six minerals mentioned in the first paper of this series as composing the hulk of the beach sands, the followiug enter largely in the compositiou of our stream sands:

*GROUP 1.—ABUNDANT MINERALS.	Specific gravity.	Hardness.
Iron pyrites	4.0 —5.2	6 —6.5
Marcasite	4.8	6 —6.5
Limonite	3.6 —4.0	5 —5.5
Psilomelane	3.7 —4.7	5 —6
Cassiterite (tin ore)	6.84	6 —7
Garnet	3.15—4.3	7 —7.5
Olivine	3.5	6 —7
Zoisite	3.35	6 —6.5
Epidote	3.4	6.7
Bronzite	3.2	5.5
Titanite	3.6	5 —5.5
Hornblende	3.2	5 —6
GROUP 2.—OCCASIONAL MINERALS.		
Diamond		10
Corundum		9
Topaz		8
Spinel	3.6	8
Beryl	2.7	7.5—8
Tourmaline	2.9 —3.3	6.5—7.5
Tantalite	7 —8	6 —6.5
Rutile	4 2	6.5
GROUP 3.—ADDITIONAL MINERALS OF THE MIXED STREAM SANDS.		
Gold-bearing quartz	2.6 —19	.....
Mercury	13.56	.....
Arsenical pyrites	6 — 6.4	.....
Copper pyrites	4.1 — 4.3	.....
Zincblende	3.9 — 4.2	.....
Galena	7.2 — 7.7	.....
Wulfenite	6 — 7	.....
GROUP 4.—METALS AND ALLOYS OF THE STREAM SANDS.		
Gold	15.6 —19.5	.....
Gold amalgam	15 —18	.....
Platinum	16 —19	.....
†Nickel-Platinum	14.6 —16	.....
Iridosmium	19.3 —21.1	.....
Nickel-Iron	7.5 — 8.5	.....
Copper	8.8	.....

*Specific gravities and hardness are mainly from Dana's System of Mineralogy and Rosenbusch's Physiography of the Rock-making Minerals.

†Noted and described by Melville Atwood of San Francisco.

It should be noted that the ahove mentioned minerals exceed 3.00 in specific gravity, and go ahove 5.00 in the scale of hardness. The silicates, oxides, etc., of the first and second groups are chiefly interesting to the minerallurgist, while groups three and four comprise most of the economically valuahle minerals. Cassiterite, in the form of stream tin and wood tin, was noted years ago in the gold mines of Australia, and is now an important element in the miues of Queensland. It is found in many of the channels of California, and occasionally in quantity. Nickel-iron is seldom seen in California, but is abundant on the lower Fraser river in British Columbia. All of the minerals of the third group are derived from the tailings of gravel mines and quartz mills. The gold amalgam comes from the same source, and has originated from a chemical comhination between gold and mercury when long in contact. It is generally found crystalline.

The original stream sands of California, obtained in placer mining, were for years entirely neglected and thrown aside as worthless, until some twenty years ago a few of the drift miners, noticing the quantity of rusty or coated gold carried by them, proceeded to treat them by very simple methods, chiefly by crushing aud grinding in large mortars. The result was geuerally quite satisfactory, and many thousands of dollars were thus saved. Later, some of the large hydraulic mines treated a portiou of their black sands, and always with profit. Instances of such treatment occurred at the Bald Mountain drift mine of Sierra county, and at the noted Smartsville hydraulic mines of Yuha county. Still no systematic method of working all the hlack sand was adopted, and no effort whatever was made to concentrate these sands from the tailings and thus obtain the gold lost in mining operations. Meanwhile the enormous masses of debris deposited chiefly from the hydraulic mines in many of the rivers of California and their branches—notably in the Yuba, Americau and Bear rivers—led to the agitation which resulted in the cessation of hydraulic mining. During the period the Debris law has heen in effect heneficent Nature has intervened to remedy the apparent waste and destruction. The waters of the Sierra Nevada, now free from their constant hurdens of sand and sediment from human operations, have gradually but silently been sorting, grading, moving and concentrating the waste sands, and new deposits are forming hy the constant reduction of the tailings in hundreds of the streams in this State, containing in a concentrated form most of the valuable portions of the original debris. From these later deposits, and from original operations as well, come the stream sands that have furnished the material for the writer's investigations. These have chiefly been made on material from the counties of Butte, Plumas and Sierra, and from all classes of mines, but have also been supplemented by work on all samples ohtainahle from Yuha and Nevada counties and other portions of California. British Columhia and Oregon have also furnished samples for iuvestigation.

As the main ohject of the writer's studies in this line of inquiry was to determine the gold contents of the stream sands and to devise methods for their economic treatment, it hecame necessary to adopt some standard by which to define the stream sands as contrasted with other gold-bearing constituents of the gravels. For this purpose a standard of size of grain of sand was adopted of one-eighth inch diameter and lower, and of specific gravity of finished sample from 4.00 to 5.00. The grading and sizing was made hy riddles and sieves, and no concentration attempted until a size of oue-quarter inch was reached, when panning or percussion was used to standard size, below which very careful panning served for concentration of sample. In sampling original stream sands all gold above one-thirtieth inch in diameter was elimiuated, as helonging to the material treated successfully hy the methods now in use. The halance of the gold was extracted as far as practicable hy mechanical means, the pulp treated chemically, and finally determined hy fire assay whenever required.

In sampling tailings all the gold was retained to the final results.

The physical condition of the gold and other minerals was studied under the microscope and during every stage of the treatment with special reference to the character of the final waste products of the test.

Most of the samples sent to the writer, at his request, had previously undergone a most careful stripping of gold contents hy panning until not a color would he visihle to the unaided eye in a two-pound sample. Nevertheless, under treatment gold hecame speedily visible, and one such sample of black sand from tailings gave $354 per ton as the final result.

(To be continued.)

A System of Displacement.

W. W. Priestley, of Butte, Mont., is the inventor of a new pumping system which is now undergoing a practical test at the Gagnon mine. The *Inter-Mountain* says it is the simplest affair ever devised for raising water from mines, and those who have seen it at work are anxious to see it tested side hy side with some of the best pumps in the district, in order to determine its efficiency. The apparatus at the Gagnon consists of a three-inch pipe located in the pump shaft midway between the 1100 and 1200-foot levels and extending to the latter station. At the 1200-foot level this pipe makes a return bend and follows up the shaft to the 1000, where it is so connected that the water which passes through it empties into a tank at that station. This pipe thus forms a U, with one leg 50 feet and the other 200 feet long. A quarter-inch air pipe is inserted at the hottom of the long end or lift pipe, and when a certain pressure of air is turned on from the compressor and water is allowed to flow through the short leg, a constant flow of water is maintained down the drive pipe, and an intermittent flow of air and water is discharged through the lift pipe into the tauk at the 1000-foot level.

This system is known as one of displacement, the air displacing the water and causing it to rise until it eventually forces it out at the top. The fact that a quarter-inch air pipe, through which air at a pressure of twenty-three pounds flowed, actually forces the water through a three-inch water column to a height of 200 feet was doubted hy many until seen. To show the workings of the system, Mr. Priestley has constructed a very ingenious model of the pipe, attached to an air compressor. Working on the principle that, if air would carry water up, as it does in this case, water would certainly drive air down, he has reversed the lifting system and is enabled to carry air into a receiver, with a fall of four feet. The air thus compressed is then discharged in the same manner as it is in the ordinary air compressor used in the mines. By this system it is conclusively shown that the height to which a given pressure will lift or force water depends entirely upon the proportion of air to water in the lift pipe, and one of the advantages claimed for it is that a high column of air and water can be maintained with a low pressure, thus making it possible to utilize California redwood and kindred material as water columns. The system, it is helieved, can also he successfully applied to irrigation and placer mining purposes.

WHETHER or no the powerful searchlights used as safeguards in coast defense and on board ship are of much practical service against attacks from torpedo boats is still an open question. Tests recently carried on hy the Government show that a good torpedo boat carefully managed can approach to within 800 yards of the projector before being sighted, although she may be directly in the beam of light. This distance is the maximum torpedo range; and, as guns cannot be trained instantly under the most favorable conditions, a hoat would have time to make great progress, and perhaps inflict fatal damage; hefore she could be fired at. The German Government is having its boats paiuted bluish gray, as this color seems to he least visible by electric light.

Vanderbilt Mining District.

Written for the MINING AND SCIENTIFIC PRESS by Fred E. Lewis.

The mining camp of Vanderbilt is located in San Bernardino county, State of California, being only twelve miles west of the State line of Nevada, and thirty-five miles northwest of Blake (formerly Goffs) on the Atlantic & Pacific Railroad, and four miles north of Manvel, the present terminus of the Nevada Southern Railroad, the boundaries of the district being as follows: Commencing at a point on State line between California and Nevada near the Needles mountain, lying south of Crossman spring, thence northwesterly ten miles following the State line, thence southwesterly ten miles, thence southeasterly ten miles, thence northeasterly ten miles to place of beginning. This district was legally organized on the twenty-first day of March, 1891. It derives its name from Vanderbilt springs, located and named by government surveyors many years ago, and not as is generally supposed from the millionaire mine owner. The altitude is about 4400 feet, the climate being very hot in summer and temperate in winter. As a rule, a few inches of snow will fall in the winter and melt the next day. Most of the people live in tents the whole year.

The town of Vanderbilt, following the example of a great many old California mining camps, is built in a gulch, the houses being built on the side hills and the bottom of the gulch used as a street. It is built up of lumber and tents. A great many of the miners live in dug-outs and tunnels. Following is a description of the chief mining properties in Vanderbilt and vicinity.

Quartz Mills.—The Gold Bronze Mining and Milling Company has a ten-stamp mill which crushes about nine tons of rock every twenty-four hours, it having two concentrators. This mill is well supplied with water from Willow springs, it being piped for a distance of two and one-half miles. A. G. Campbell has a ten-stamp mill, with two concentrators. This mill has a capacity of twenty tons of ore per twenty-four hours. The power is furnished by two 50-horse power boilers and a 100-horse power engine, it being ample to run sixty stamps. Mr. Campbell's intention is to use the extra power in running an air compressor. This condensed air will be transmitted to the Boomerang shaft by means of pipes, where it will be utilized for hoisting purposes and for working rock drills. The supply of water is obtained from the Boomerang shaft, but is not sufficient at present, the mill only running twelve hours per day owing to the scarcity of water. The quantity is daily increasing as the shaft attains depth; in fact, if it increases as fast as it has done for the last fifty feet, at 600 feet or even if levels are run at 500 feet there will be an ample supply of water to run the mill night and day. Wood is used for fuel at these mills and it costs $5 per cord delivered.

Gold Bronze Mine.—This claim was located on February 1, 1891, by J. K. Patton, R. C. Hall and S. King, and has been more extensively worked than any other property in camp. Upon this claim four shafts have been sunk on the main vein, and several other shafts on cross ledges, most of these having been sunk by leasers. The main shaft is 245 feet deep; the west shaft, 49; shaft No. 2, 50; shaft No. 3, 83, and the Taggart shaft, 69. Fifteen hundred feet of drifts have been run, with thirty feet of crosscuts, and 310 feet of winzes have been sunk. Considerable stoping has been done. The ore is raised from the main shaft by means of a double-cylinder, flat-friction hoist of thirty-horse power. The steam is furnished by a sixty-horse power steel boiler for both the hoisting engine and mill. To give an idea of the quality of the ore shipped from this mine, we present a tabulated statement of the shipments for the year 1893. This was before the mill was built, and all ores had to be shipped by rail with the exception of 164 tons of second-class ore which was shipped to the Keystone mill, making a haul by wagons of forty-five miles.

Gold Bronze No. 2.—This claim was located as an extension of the Gold Bronze mine, by the same locators and upon the same day. Very little development work has been done upon this mine, although leasers have shipped some rich ore. Three hundred and twenty-four tons of ore, averaging $90.47 per ton net value—after deducting $62.94 per ton for transportation and working—were shipped from this mine by the company.

Gold Bar and Gold Bar West Extension Mines.—This property was purchased by Mackay, Flood and Siste from the locators for $40,300 cash. This property is now known as the St. George mine. It is a good property, but not big enough for the owners to manipulate stocks on, so they prefer to let it lie idle, freeze out some of the smaller owners and continue to give the camp a black eye. I have it on reliable authority, from a gentleman who has made hundreds of assays from samples of this mine, that there is enough ore in sight in the drifts and shafts to pay for the erection and running expenses of a ten-stamp mill. There are four shafts sunk upon this property, the deepest of which is 325 feet. The ore at this depth will run $37 per ton in gold. Three hundred feet of drifts have been run, in ore all the way. There is ample water in the shafts to run a ten-stamp mill. A hoisting engine and pumps are used at the main shaft.

Queen of the Night.—The main shaft on this mine is about 100 feet deep, showing a body of high-grade ore. A tunnel has been driven along the vein, and considerable other development work has been done. For the amount of work performed, this is one of the most promising looking mines in camp. There is about three feet of water in the main shaft, which, when hoisted out, will rise to the same level in twelve hours. A whim is used for hoisting purposes.

Boomerang Mine.—This mine is owned by A. G. Campbell. The main shaft is 500 feet deep, with ore all the way. Levels have been run from this shaft connecting with the east and west shafts, which are 100 feet deep. Three hundred tons of ore from this mine, run through the Campbell mill, averaged $22 per ton in gold, eighty per cent of which was saved in the bullion and ten per cent in concentrates, leaving ten per cent in the tailings. Adjoining this mine are located the following mines, all owned by A. G. Campbell, and all showing more or less high-grade ore: Brick, Little Brick, Little Brick No. 2, Iron, Webster, Alta, Mill Site, Mill Site No. 2, and several others. There are several other good-looking prospects in this camp, but the owners are waiting for some one to come along and pay them a good price for a piece of ground that a pick has not been struck in. What this camp needs is capital to develop some of these prospects. Then, and not until then, will Vanderbilt make a good camp.

Crescent Mining District.—This district is located about twelve miles northeast from Vanderbilt, and is in Lincoln county, Nevada. The Legal Tender Mining and Milling Company has a five-stamp mill. This mill has one concentrator and crushes about ten tons of gold ore per day of twenty-four hours. This ore has averaged $23 per ton in gold, 72 per cent being saved in the bullion, 22 per cent in the concentrates and 6 per cent going in the tailings. The water used in this mill is pumped from a well fifty feet deep, and the supply is inexhaustible. The Legal Tender mine is located three miles east of the mill, the ore being hauled this distance by wagons. Shaft No. 1 is 220 feet deep and shaft No. 2. is 160 feet in depth; from these shafts there are 900 feet of drifts run, with stopes, winzes and upraises. The footwall is composed of granite and the hanging wall of porphyry. The vein is four and a half feet wide and the pay streak will average eighteen inches.

Phelps Bros. have 100 feet of shafts and 120 feet of drifts at their mine. The vein is four feet wide and the pay streak from ten inches to two feet in width at about 250 feet in depth and increasing in value in nearly the same proportion—milling about $25 to the ton in gold at the surface and over $100 per ton at 250 feet in depth. Water is reached at a depth of 100 feet from the surface and increases as depth is attained and more ground opened up.

width. Thirty tons of ore shipped from this mine to the Legal Tender mill netted $45 per ton.

At Hassett Bros.' mine they have a shaft fifty feet deep, with sixty feet of drifts and open cuts. The vein is three feet wide with a pay streak from ten inches to two feet in width. Twenty-nine tons of ore were shipped from this mine to the Legal Tender mill, which gave returns of $20 to the ton in gold.

Keystone Mining District.—The mill, which has ten stamps, is situated about forty-five miles north of Vanderhilt, and is three-quarters of a mile east of the corner common to San Bernardino and Inyo counties, California, and is in the State of Nevada. The mine is located seven miles easterly from the mill. This mine has paid large dividends and is a first-class property. A few miles to the east of this property is the Goode Springs mining district, which is almost entirely a lead and silver camp. Thousands of tons of lead ore are anxiously awaiting the arrival of the Nevada Southern Railroad, which is going to start to extend its road on the first of next month.

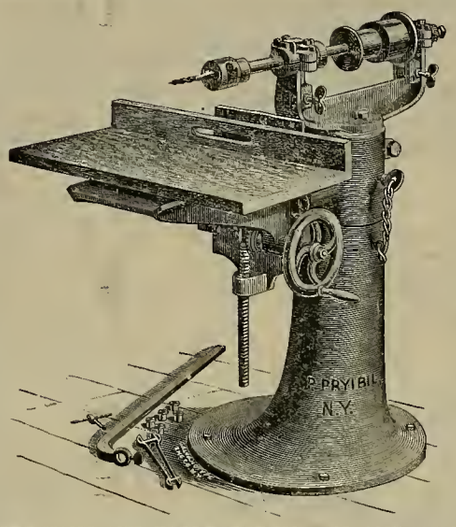
Vanderhilt is the central point for the following mining districts: Goldstone, Ivanpah, Shadow Mountain, Crescent, El Dorado Canyon, Goode Springs, Keystone, Sterling and Montgomery.

Angels.

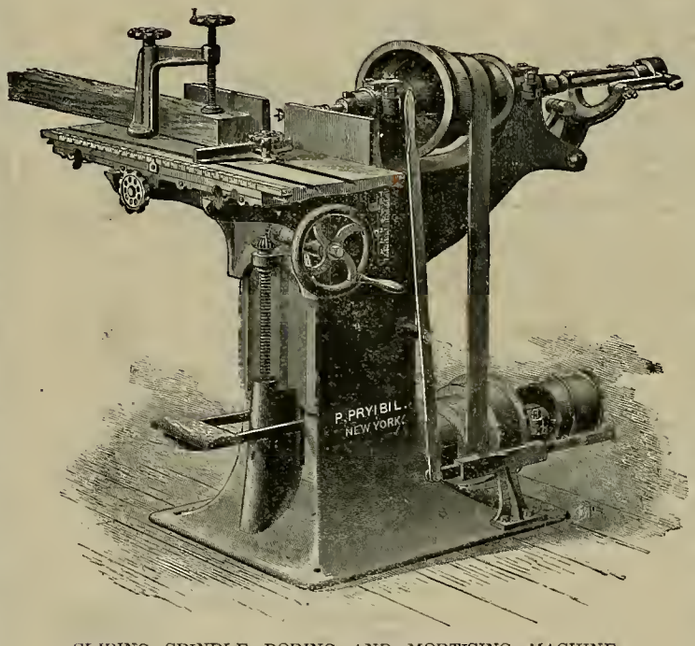
TO THE EDITOR:—To the old subscribers and those who have visited Angels within a year past, there is but little that is new. Mr. C. D. Lane put it very concisely when he replied to my question of "What shall I say for the Utica?" by answering, "Well, you can tell the boys that we're still doing business at the old stand and pegging away old fashioned." There has at no time been any signs of a boom at Angels. The leading mines work along like some machine, increasing the plant and force as they are required. If there is any boom, it is in the gradual and steady extending of the town limits and in the new residences that are being erected in every direction. When the extent of the mineral belt at Angels is considered, the present operations are scarcely a beginning to mine. I have been over this ground since 1870, and each trip confirms me in the belief that Angels is destined to be the greatest mining town in the State. The town is right on the mineral zone which here crosses the country from east to west, while the numerous veins run from south to north and northwest. One mile east of the Utica are the Birney mines with their large bodies of mineralized slates. Between these mines and the Utica no prospecting has been done. West of the Utica is the Johnnie Meyers, on what is called the middle branch of the mother lode; and still farther west is the Madison and others on the west branch. To the west is a flat section that has been ground-sluiced off, almost the entire distance, and shows numerous unprospected ledges, while a mile west of the Utica is the Blair mine with its large body of high-grade ore, and still farther on a half mile to the west is a strong ribboned quartz ledge resembling the mother lode in Amador county. There are other very strong ledges outside of these boundaries, but in this belt there is a space of two and a half or three miles wide across it, traversed by strong ledges and mineralized bodies of slate, thus giving this section an area of undeveloped mines beside which the few in operation are scarcely a scratch on the surface. Then, too, there is a long stretch of virgin ground to the north, running for miles in extent, while but little has been done to the south. The investor has but to carefully examine the locality to see that at Angels an unlimited amount of capital can be invested in the development of virgin ground.

The Utica Mining Company, C. D. Lane, general manager, being the largest operator and heaviest producer of bullion, places it at the front. On the Utica-Stickle mines the sixty stamps of both mills are constantly dropping, giving the company, with the forty stamps on the Madison, 160 stamps under its name.

All of their plants are operated by water power from their own ditch systems under 400-foot pressure. At present the company is putting in an electric lighting plant that extends from their plant about a mile above Murphys to Angels, a distance of about eight miles. This plant will furnish light for all of the mines, mills, streets and houses of Angels, and will be a great convenience and blessing to all parties. The chlorination works of the Utica Co., with their four furnaces, handling seventeen tons of sulphurets every twenty-four hours, are the largest known, and owe their reputation for good work to the gentleman in charge, Mr. T. M. Smith, under whom the plant has grown to its present proportions. John Reaves, who had been Mr. Hayward's trusted millman for years, has "gone over the divide," and his assistant, Mr. W. J. Loring, appointed in his place. Mr. C. D. Lane's son, T. T. Lane, is general superintendent of the company's mines. It is hardly necessary to say anything of the Utica's output, as it is a matter of history, but at this time the Stickle is said to be producing "candle-box ore" in goodly quantity. The management of the whole property shows how it is possible to work a large property to a greater profit than a small one. There are no "soft snaps" held down by friends, but every man on and about the property has to be up and doing to "get there" on time. This is particularly noticeable in the mills. Step into the Madison mill and you will find that one man is doing all the work on his shift, thus reducing the labor per stamp to almost nothing, and in no way to be compared to the small mills with about one man to the stamp instead of one to forty. Of course this requires the millman to get a move on him, and all the Utica employes seem to have caught the spirit of the management and work together like a great piece of machinery in producing the results that have made the Utica famous. At the Madison the superintendent, Mr. Naylor Williams, has the shaft



FREE HAND AND TABLE BORING AND MORTISING MACHINE.



SLIDING SPINDLE BORING AND MORTISING MACHINE.

down over 900 feet, with levels all run on a seventy-five foot vein, and sufficient ore in sight to keep the mill running for many years to come. Climbing up the upraises in this mine is more like scaling the side of a mountain on account of the magnitude of the ore bodies. The shaft is on the hanging wall vein. What answers for a foot wall is evidently a horse of slate or the gangue of the vein. The present workings are all done dry, which goes to show that the footwall has not been reached, while on a property to the north there are two strong ledges, still west of this vein, and the extreme west ledge is in a sea of water. The Madison is an immense mine as it is, but with a crosscut run west 300 feet to the footwall there will be scarcely any limit to its possibilities. Just north of the Madison is the old Gold Cliff, where W. Garrard mines and mills for 65 cents a ton from his quarry 100 feet wide. North of this is the Smyth, Ryland & Brown Co.'s mines, where three veins are shown. South there is but little doing save on the Bolitho & Tullocks mine. In the Bolitho they have several veins from eight to thirty feet that they claim mills from $6 up. On out beyond the Bruner, which is idle, is the Carson Creek M. Co.'s mines, formerly known as the Doc Jones mine. Mr. E. W. Roberts, the superintendent, has put in a new hoist since my last visit and has the shaft down to 465 feet, and is still sinking and drifting on the vein. A crosscut of forty feet has been driven on the 400-foot level without reaching the wall. In the upper levels the vein is eighty-five feet wide. The mine is equipped with a complete forty-stamp mill operated by water power. Owing to the nearness of a line reef the ores differ from those at Angels in this that there is a small per cent of free gold and a large per cent of silver in the form of tellurides. East of Angels the Birney mine, with Mr. T. L. Birney as superintendent, is just getting its five-stamp mill in operation. The company have four locations on two parallel veins. The ore bodies are very large and carry about five per cent of sulphurets that go $65 a ton. The free gold value has not been determined. With the present mill the company can develop and prove their mines, and appearances would indicate that it will prove a big property. West of Angels a Seattle company have put up a five-stamp mill on a sixty-five foot shaft. Their surface prospecting shows a mineralized belt seventy-five feet wide that they claim will mill $10 a ton. To the west the Eclipse is idle, while the Gold Hill is dropping ten stamps. South and still west J. J. Schmadeke has the shaft down 268 feet on his Blair mine and a crosscut run eighty-two feet without striking either wall. The twenty-stamp mill is running on ore said to mill from $20 to $22 a ton. The mine is under bond to a New York company. About five miles east of Angels and near Vallicita a Michigan company, with A. Lunberg as superintendent, has put a shaft down sixty-five feet and are drifting on the Isabella mine. The gravel mines of Vallicita are idle, but at Balakalava Hill, just south of Vallicita, a company have struck the old channel at a depth of over 200 feet and claim six feet of gravel that goes $15 to the car. North, at Douglas, McCormick, Frishee & Thomas have completed their tunnel to Central Hill, above Murphys, and will soon have their mine in operation. If space would permit, a detailed description of these and many other mines in the vicinity of Angels would no doubt prove of interest, but the investor contemplating investment cannot do wrong in visiting the camp, where, if he will make his own examinations and steer clear of bar-room experts, he will find no trouble in securing a promising claim at a nominal figure.

E. H. SCHAEFFLE.

Murphys, Cal., Nov. 26, 1894.

Free-Hand and Table Boring and Mortising Machines.

Herewith are illustrated a free-hand and table-boring and mortising machine and a sliding spindle boring and mortising machine, made by P. Pryibil of New York. The former is designed for boring either with or without the aid of a work-table.

The table has a vertical movement of eight and one-half inches, slides forward and back; and, when made for mortising, sideways also. Adjustable stops limit the extent of all these motions.

Mortising is done with a revolving tool, cutting on both end and side, producing, when the work is moved sideways, a mortise with half-round ends.

The slides upon which the table and its knee are held are fitted to the round body, and are held in position by a pin. When free-hand work is to be done the pin can be withdrawn, and all of these parts swung around to the side of the body, leaving the front clear of all obstructions.

The latter is adapted to a large variety of work, including rosette cutting and mortising, done by a tool cutting at both end and side, producing, when the work is moved sideways, a mortise with half-round ends.

The spindle is of steel, fitted to a steel tube, with which it revolves and in which it slides. The wear is thus confined to the tube, where it can be easily taken up by adjustable caps. When spindles slide in the same bearings in which they revolve, they become smaller at one part than at another, and a perfect adjustment is then impossible.

The spindle has a longitudinal movement of six inches, and it is provided with an adjustable, gibbed stop-collar.

The table has a movement of ten inches in the direction of the length of the spindle to enable it to be set close to hits of various lengths and to enable rosette and mortising cutters to be used close to the bearings.

It also has a vertical movement of twelve and a lateral movement of twenty-six inches. The latter is effected through a hand-wheel in front, and its extent can be limited by two adjustable stops provided for the purpose.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XIV.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894.

Asphaltum was known to the aboriginal inhabitants of California, perhaps long before the advent of the Spaniards; it is certain that they knew some of its properties. This is proven by an interesting relic shown me in San Luis Obispo county, by Mr. James Cormack. It is a stone mortar which has been broken by the pestle, the bottom having become thin by long continued use, perhaps by several generations. An attempt had been made to mend the utensil with asphaltum. This ancient record was found deeply buried in the driven sands, overlying the bituminous deposit.

1602.—The first notice of petroleum in California that I can discover, may be found in the account of the voyage of Captain Sebastian Viscaino, in the year 1602, written by Father Miguel Venegas in his "Natural and Civil History of California," published in Spanish in Madrid in 1758; and in English in London in 1759. The following, quoted from "Monarchia Indiana," written by Father Juan Torquemanda, may be found in Vol. II, folio 253:

"The Capitana and tender did not meet with that obstruction from the painted mountain as the Almirante had, but entered a good harbor, which they called 'San Bartholomew,' three leagues on this side of the island of Ceros. Here the General sent Ensign Alarcon and some soldiers in search of water, but they found none, that country being exceedingly barren. Along the shore they indeed met with a kind of resin, but, being of an ill smell, they did not think it worth while to take any of it with them. According to their account, it should seem to be amber; but whatever it be, there is enough to lade a ship."

Asphaltum was well known to the Jesuit Fathers in California, who used it for roofing and other purposes. The black maltha, oozing from the hillsides or standing in pools, and the hardened variety, called by them "brea" or pitch, were well known and familiar objects. They knew also of the oil floating on the sea in the Santa Barbara channel, but were not aware of its origin or value.

1841.—In 1841-2 M. Duflot de Mofras visited California in the interest of the French Government, and his report was published in 1844. He noticed and examined the numerous "tar springs." The following translation is by Professor William P. Blake (Pacific Railroad Reports—Geology, Vol. V, fol. 284). The original may be found in "Explorations du Territoire de l'Oregon, des Californies et de la Mer Vermeille, executee pendant les anuees 1840, 1841 et 1842.—Paris, 1844."—Vol. I, folio 357:

"Two leagues southeast of Los Angeles there are four great sources of asphaltum, situated on a level with the earth in a vast prairie. These springs open in the middle of little pools of cold water, while the bitumen possesses a higher temperature. The water has a mineral taste, which, however, does not prevent animals from drinking it. At sunrise the orifices of these springs are covered by enormous bubbles of asphaltum, often being more than a yard high and looking like soap bubbles. According to the warmth of the air, the gas contained in these bubbles expands and bursts, producing a rather violent detonation. The inhabitants gather the solidified asphaltum and use it for covering the roofs of their houses, formed of reeds or pieces of wood. Vessels carry the bitumen to different parts of the coast. This material has, nevertheless, the inconvenience of melting in the sun, running down from the roofs and penetrating through the roofing. The houses covered with it require particular care but small expense, since the springs are worked by any one according to their wants."

1850.—While it has been shown that the existence of asphaltum and maltha in California has long been known, it was not until 1850 that any noteworthy attempts were made to produce artificially or to discover mineral oil; although Andreas Pico knew the locality, now Pico canyon, a number of years before that date, and actually made a little oil for the San Fernando mission, in a little still. He was, therefore, undoubtedly the pioneer oil producer of the State.

1853.—Professor Blake thus describes the manner of making asphalt roofs, at the time of his visit in 1853:

"The residents of Los Angeles make use of large quantities of the material for covering their buildings and for pavements. It enables them to make roofs that are almost level, completely water tight; and it is spread upon them in the following manner: The asphaltum is taken early in the morning, when it is cold and brittle, and broken into small fragments; it is then spread upon the roof, and the heat of the sun melts it down into one homogeneous crust. When the inclination of the roof is great, or the asphalt freshly applied, it runs off at the eves and is a source of annoyance to pedestrians. After a considerable quantity has thus run down, it is thrown up again, until at last it becomes so much hardened that it is no longer made liquid by the sun. * * * * * The value of this material for making pavements, soft cement and the manufacture of gas and oil, cannot be lightly estimated, and it should be regarded as one of the valuable mineral productions of the State."

1854.—In 1854 G. S. Gilbert gathered and distilled oil on the Ojai rancho, and Julio Peralta dug pits and gathered crude maltha.

DEWEY & CO'S
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Advice and Circulars free.

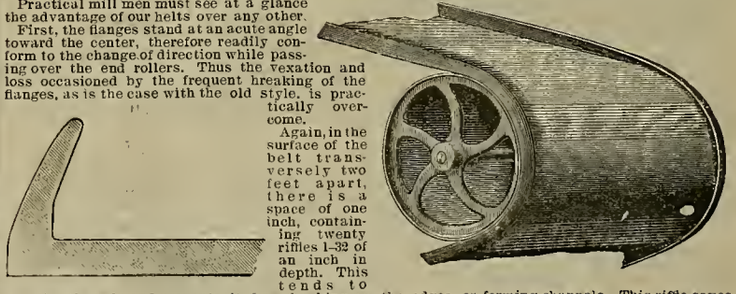
Or, Address the Company at its Denver Office.

Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.



Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty rifles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

Luminescent Electric Lights.

H. Ebert contributes a paper to *Wiedemann's Annalen* on the prodnction of light by high frequency currents, in which resnlts are indicated likely to prove of importance. The fundamental difference between the light and that associated with Tesla's name seems to be in an insistance upou the principle of resonauce. He says that it is not necessary to use high tensions since it has been found that intense light effects can be produced by the movemeut of exceedingly small quantities of electricity, provided only that the oscillations follow each other regularly and are persistent. The luminous substance of Ebert's "luminescent" lamp is said to be a small disk of compressed luminous paint. This is enclosed in an exhausted glass receiver npon the external surface of which are glued two strips of tin foil to which the terminals of the circuit are attached. When the electric oscillations act npon these coatings, active cathode rays are formed on the inner surface. These, though almost iuvisible themselves, produce a strong luminescent light upon the surface of the luminons paint.

To determine the efficiency of the lamp it was compared with the amyl acetate standard. Its candle power was fonnd to be about one-thirtieth of this, which is approximately equal to the standard expended in producing this light—only about one-millionth of a watt.

Economy in Superheated Steam.

In the long series of losscs that occur in the latent power of fuel burned nuder a steam boiler, one of the most important is that which results from condensation in the cylinder. One of the devices resorted to in order to lessen this waste is to surround the cylinder with a chamber in which there is live steam, thns maiutaining the heat of the walls of the inner receptacle. Another is to let the steam do only part of its work in the first cylinder, and then enter a second, and perhaps a third and fourth, before its energy is all utilized. Besides usiug a steam jacket aud compounding the engine, it has also been proposed to superheat the steam before making it drive a piston. Steam taken right off from the water in a boiler has only the temperature of boiling water. In that condition it is said to be "wet" or "saturated;" and the slightest reduction of its temperature will be attended with partial condensation. If, however, the steam be let off into another vessel and there subjected to a higher heat, it can undergo contact with thc cylinder without the same liability to condensation and loss of power. Obviously, there would be no economy if it took too much more fuel to do the superheating, or, if the added apparatus were very costly. But by so arranging the snperheater that what would otherwise be waste hcat may be ntilized, there is a net gain in work performed.

Effect of New Inventions.

While labor-saving machinery and new inventions curtail the need of manual labor in the affected industries, they cheapen production and frequently transform to practical necessaries what under the old order were luxuries. Thus labor that is dispensed with in one form finds call for occupation in another. The introduction of electric cars for street railways has cheapened horse flesh iu the cities and reduced the profits of the shippers of and dealers iu horses, but it has furnished labor with a new outlet in the direction of the installation of the electric system, with what that involves of improved highways, more substantial tracks, the stringing of wires, the building of expensive cars aud the erection of suitable power buildiugs, eqnipped with costly dynamos. A case in point is the construction by the Metropolitau Street Railway Company of New York, at a cost of almost $1,000,000, of a five-story building, to be nsed principally for the storing of 250 cars. Immense elevators will be used to lift the cars above the ground floor. Great as this expense will be, the company regards the project as one iu the direction of an cconomical management of its railway system.

Platinum.

Platinum, when used for chemical laboratory instruments is hardened by the addition of a small percentage of iridium. This forms au alloy much harder and more tenacious than pure platinnm, besides offering a greater resistance to the action of chemical agents. An alloy of platinum with ten per cent of iridinm is only slightly attacked by aqna regia, which readily dissolves gold. This is due to the formation of a thin film of iridium upon the snrface, which reuders it indifferent to chemical action. Although platinnm is not oxidized or rusted by the air at any temperature nor attacked by any single acid, yet it is not by any means invulnerable. There are many substances which attack it—phosphorus and arsenic, for instance—and direct contact with burning charcoal renders it brittle and liable to crack. When platinum utensils become gray and brittle from this and similar causes a systematic application of moist sand after using will restore their brightness and materially prolong their life.

The Ural platinum deposits in Russia are said to be the only ones in the world, as this metal is worked nowhere else, and is known simply as a mineral finely disseminated in certain rocks. Platinum occnrs in the Ural Government of Perm, where it is found on various private properties and State lands. In the district of Goroblagodat there are seventy allotments for the exploitation of platinum nnder different private individuals. At present all the platinnm extracted in the Urals is forwarded in the crude state to St. Petersburg, whence it is sent abroad. Although there are two laboratories in the Russian capital for refining platinnm ore, the greater quantity is seut abroad in the crude state. The largest quantity of platinum is now extracted at the deposits of Nizhni-Tagilsk, belonging to Priuce Demidorff San Donato, and at the Krestovosdvigensk deposits of Count Schouvaloff. In 1890 there were 6000 workmen employed in the exploitation of platinum.

There are said to be only six tons of platiunm commercially in existence; it is indispensable for glow electric lamps, for no other metal as good an electric conductor can be fused into the glass. Therefore, its price has increased within recent years many hundred times, and threatens to go higher yet. Either a substitute conductor will have to be discovered, or a new variety of glass made with a coefficieut of expansion uearer that of ordinary metal.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could he conveniently removed. Can he had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

UNITARIAN LITERATURE sent free by the Channing Auxiliary of the First Unitarian Church, cor. Geary and Franklin Sts., San Francisco. Address as above. Mention this paper. *

SITUATION WANTED BY ENGINEER AND machinist who understands the running and care of electric plants. Engagement preferred with parties interested in the use of electricity for the reduction of refractory ores. WM. H. RUE, 242½ 12th St., San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from G. H. Pease and J. B. Colwell in the North River mine, near Yankee Jims, Placer county, Cal., to impound tailings behind dam in Mexican Gnich; and from the Crown Point Mining Co., in their mine in the Tp. of Goodwin, Plumas county, Cal., to impound tailings behind log and brush dam in Porter Ravine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Dec. 17, 1894, at 1:30 P. M.

TUBBS CORDAGE CO.
(A CORPORATION.)

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc. etc. ☞Extra sizes and lengths made to order on short notice

611 and 613 FRONT ST., San Francisco, Cal.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called ruptnre—was incurable, except by snrgical operation, which is both dangerons to life and very rarely ever successful. Bnt DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enongh do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cnres him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.

Gold and Silver Refinery
—AND—
Assay Office.

HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.

Manufacturers of
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.

Mechanical Progress.

Ogden's Great Electric Power Plant.

Details of the proposed electric power plant at Ogden, Utah, are published in the Salt Lake *Tribune*. The plan calls for damming the Ogden river, at the upper end of a narrow canyon in the Wasatch mountains to the northwestward of the city. The structure will be 450 feet long, 60 feet high, curved slightly, placed with the convex side upstream, and have rock ledges for abutments. It is intended to impound enough water to maintain the production of 10,000-horse power the year round.

For nearly five miles along the canyon the water will he carried from the dam in a circular wooden conduit, put together like a barrel, with staves and steel hoops. The former will probably be of either California redwood or Texas pine, two inches thick, and the latter five-eighths of an inch thick. This kind of conduit has been tested extensively enough in the far West to be considered safe and durable, as well as cheap. Owing to the irregularity of the bottom of the canyon, it will be necessary to support the aqueduct (which will have a diameter of six feet) on trestles at various places. In other places short tunnels must be dug. A perfectly straight pipe, however, will not be attempted. To adapt the conduit to some of the depressions in the line, curved elbows of steel will be employed. At least sixteen angles will be thus provided for, and it is not believed that the flow will he sensibly affected thereby.

The canyon terminates nearly a mile from the point selected for the power-house in Ogden, and for this portion of the route a steel tube will he necessary. At the terminus, the head of water (or level below the surface of the reservoir) will be 350 feet. In the power-house there are to be ten dynamos, each directly connected with its own turbine wheel, and capable of delivering a plump 1000-horse power in the form of electricity. Not over one-quarter of this energy is likely to be utilized by existing industries, but it is hoped that new ones will he established in that vicinity soon after the completion of the works, thus creating a good market for the power about to be developed.

As illustrating the loss of fuel which may arise from improperly hanking fires under steam boilers at night, the *Electrician* cites an instance in which it was the practice to bank the fires at 6 P. M. and close the main damper of the fire, leaving the fire doors open. The hoilers were of the water-tube type and at the time of hauking carried 100 pounds steam pressure. The main damper was not perfectly tight, and sufficient air was drawn in to cool the hoilers until the pressure had fallen to ten pounds when the fires were opened at six o'clock the next morning. Subsequently the practice was changed by closing the fire and ash doors, and by also closing hand-dampers in the flues, which were found to be tighter than the main dampers. As a result, the steam pressure in the morning was invariably found to be at least forty pounds, and the bank of coal, which under the previous conditiou was more or less consumed, was apparently in the same condition as when the fire was first banked.

A CERTAIN TEST of steam pipe coverings leads to the conclusion that it costs $15.40 to run 100 feet of naked two-inch pipe at from 70 to 80 pounds pressure for one year of 3000 workiug hours, with coal at $2 per ton. With the least efficient of insulating coverings used in the test this loss could be reduced to $4, with the most efficient to $2.64. Striking as are these figures, they are probably helow the cost of actual practice, for a steam pipe is under pressure usually more than ten hours a day, and $2 a ton is helow the average cost of coal. Prof. Charles B. Gihson, in some tests a few years ago, reached the conclusion that with coal at $4 per ton and 3000 working hours per year, the loss from a naked two-inch pipe was 64¾ cents per linear foot. The lowest estimates show the importance of covering the pipes.

THE accumulation of harnacles and other marine growths on the hulls of vessels exerts an influence upon speed and coal consumption far greater than is popularly supposed. The United States steamer Bennington recently ran from Acapulco to La Libertad, a distance of 675 miles, with a clean hull, at the rate of nearly eight miles an hour, and burned sixty-seven tons of coal. When she came back, two months later, she was able to make but little more than six miles an hour, with a consumption of no less than 129 tons of coal. This difference was wholly due to the mass of extraneous matter which had collected upon her hull, and which could not be cleared off without putting the ship in drydock. This fouling takes place to a greater or less extent in all waters, but is especially troublesome in the tropics.

IT is a singular fact that rails in tunnels last only about one-third as long as upon the open track, although subjected to exactly the same amount of wear. Nearly all the fuel used in locomotives contains sulphur, which combustion and the action of the exhaust steam in the smokestack changes to frec sulphuric acid. This issues from the stack often in as great quantities as five pounds an hour, but is soon dissipated in the open air and does little harm. In a tunnel, however, where the steam cannot escape, it condenses rapidly on the rails and leaves them subject to the direct action of the acid.

LIEUT. EDWARD BRINLEY, who had charge of the pneumatic dynamite gun on hoard the Nictheroy from the time of that vessel's commission in the Brazilian navy, has reached the conclusion that the range of dynamite guns is too small and their accuracy too poor to render them serviceable on board ship. The trials of the Vesuvius in the American navy seem to teach the same lesson and to prove that the proper place for this class of ordnance is on shore rather than afloat.

THE facilities offered for the moving of heavy machinery in the Government navy yards are seldom sufficient. When the hoilers of the Cincinnati were moved from the shops to the dock at the Brooklyn yard, the track provided was found to be much too light and "skidding" had to be resorted to. The cost of this primitive operation was over $3700, enough to have laid a suitable track the entire distance.

CEMENT PIPE, if properly made, is said to be quite as strong as the vitrified pipe more commonly used for sewers, and can be made in large sizes for considerahly less. Brooklyn is one of the very few cities in this country which continues to use the cement pipe in preference to the vitrified, and, although the former is more porous than the latter, its use has been entirely satisfactory.

A NEW TIRE for hicycles is made on the plan of the pneumatic, but has a series of transverse rubber disks within the tube, dividing its interior into a number of independent air chambers. Should one chamher he punctured the whole tire will not collapse, hut the two adjoining chambers, being still inflated, will enable the rider to continue his journey until the break can be repaired.

DR. DAGIL, a Russian physician, asserts that music produces warmth. It affects the nerve centers governing the circulation of the blood, and causes an enlargement of the blood vessels, and hence greater activity of circulation.

THE domestic uses of asbestos have increased wonderfully during the last few years. It is now made into paints, roofing, building material, cements, cloth, shovels, forks and sewing thread, and a number of other things.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE GOVER.—*Ledger:* Superintendent Hale of the Keystone has had charge of the Gover mine for some weeks, and is having the water kept out. He has put in three new electric pumps, which in about four hours' work keep the property clear of water. The mine is being kept free of water in order that if it is not disposed of in a short time, work will be resumed. The mill will soon be placed in first-class condition, so that if it does not soon pass into other hands, it will be worked hy those at present in charge.

The Zeile has suspended mining to repair the shaft and the mill. There is an accumulation in the sulphurets works which will keep them running for about two months. The shaft has to undergo a thorough repairing, which will require a small force of men, and the repairs at the mill will also take a small force.

Repairs at the Keystone mill are progressing rapidly. Twenty stamps have been put in good condition and the other twenty are now being repaired. The mortar blocks were repaired, the mill foundation renewed and new mortars put in. The new mortars are a great deal wider than the old ones and with the twenty stamps in good repair the superintendent says he is crushing about the same amount of rock he formerly did with forty.

The Swiss mine, near Railroad flat, which was bonded a few months ago hy James H. Tibbits and transferred to Dillana and Driggs, is showing a fine prospect. Men have heen at work for several weeks running a tunnel and sinking a winze. The winze is now down sixteen feet and the ledge upon which it was sunk assays $106 a ton.

General rejoicing and reconstruction is in progress at the Clinton Consolidated. The property will probably pass into the hands of new-comers, but if a sale is not effected the old company proposes to continue work. Clearing the water out of the shaft was commenced lately. C. Shea is superintending the work.

ZEILE.—Jackson *Republican:* About 100 men are laid off pending the repair of the shaft. The sump is heing cleaned out and a few stamps of the mill are in motion, crushing the rock taken from the sump.

Butte.

FORBESTOWN MINING NEWS.—At the Shakespere mine and mill the ore now being worked is taken out above water level, and there is said to be enough in sight to run the mill for two years.

WHAT A MINE WILL DO.—*Mercury:* A single mine giving employmeut say to thirty men does more good than most people are aware of. Take the Pershbaker mine on the Magalia ridge as an example. Aside from the wages paid to the miners, which is the first consideration, the mine henefits many others. Lumher is required, for this mine alone got 300,000 feet from a sawmill in the viciuity. Hay and grain are needed in considerahle quantities. The mill owners must have hay and grain, so hetween the sawmill and the mine the farmer is helped. There must be shovels, picks, drills, powder, fuse, caps, nails, iron, coal, etc., and thus the hardware stores are paid large sums. For the thirty men, together with the sawmill men, loggers and teamsters, there must be flour, beef and other provisions, so that the butcher and the grocer are benefited. Many of the lahorers are married and have little homes near the mine, and thus more money is expended for drygoods, tinware, boots and shoes and other supplies. Thus it is that a single mine employing any large numher of men confers a henefit upon all people within a radius of many miles.

PERSHNACKER MINE.—*Appeal:* The plans for the new works call for a double compartment shaft five feet deep, to connect with the face of the old incline; a pipe-line some miles in length to hring in water from the Cherokee ditch for power purposes; the erection of enough buildings to form a small town, and finally the installing of new, up-to-date, ponderous machinery to work the mine. These new machines will he models of ingenuity and correct mechanical construction. The principal power used will he compressed air, generated by the latest model Pelton wheels. Nothing like the plant that is now being erected has been seen in this part of the State hefore. The shaft is down ahout 240 feet. The work of sinking the shaft is heing done with an auxiliary steam plant, which was the first thing erected in the camp. The shaft is in a solid tough lava, and a progress of about two feet per day is heing made. It is calculated that the new machinery will he up hy New Year, and that the channel will be tapped and mining begun about the middle of the year 1895.

Calaveras.

THE GWIN MINE.—*Chronicle:* The Gwin mine has recently heen equipped with a water power hoist capable of sinking 3000 feet. The new eight hy eighteen feet shaft, timbered with twelve hy sixteen inch timher, is now down 500 feet, and the company, will never rest until the 1400-foot level is reached. A fund has been raised of $5,800, to construct an iron hridge across the Mokelumne river at Middle Bar, and connect with the Mok Hill and Jackson county road. The mine has connected with the Jackson telephone system. Work is heing vigorously pushed at the mine, and the knowing ones are sure that the old Gwin will take its place in the lead as a hullion producer.

GOOD TIMES AT MOKELUMNE. — *Chronicle:* For the past six months fortune seems to he throwing smiles on our mining interests. Many new enterprises have started, and the old claims are heginning to assume the aspect of mines. Many mining men are coming and going constantly. The camp is in a healthy state and a season of activity such as that section has not had for years, is promised.

The Gleeson mine, formerly known as the Coffee Mill claim, locatod in Chili gulch below the Junction, has come to the front as a dividend property. Steam works are used for hoisting purposes. There is a shaft 180 feet deep, where hlue gravel six feet in depth is found that pays $10 per day per man. Twenty men are engaged all told, and the gravel is washed through sluices. At least one-half the gold goes with the tailings. Mr. Gleeson is at present arranging for a ten-stamp mill.

MINING NEWS. — *Herald:* The Gold Hill mine started up recently, employing a force of seven men.

The Maltman mine on Smith's flat resumed operations for the winter, lately.

The ten-stamp mill at the Smedika mine is running regularly on good ore. The shaft is down 220 feet.

The Calaveras Consolidated mine has suspended operations for the present.

The extension of the Baumhogger quartz mine, near Altaville, has heen bonded to parties who will start at once to develop it.

The Gover mine of Amador county has changed hands again. M. J. McDonald, who was the latest owner, has made a deal with an English syndicate, on what he considers favorahle terms. There were many inquiries for the property, but this is the only one which has materialized.

Mariposa.

BIG MINING ENTERPRISE.—The Merced Gold Mining Company, recently incorporated in Butte, Montana, to operate mines at Coulterville, has decided to operate on a big scale.

Coulterville is showing the effect of the growth of interest in the mining boom there. Till recently the Tyro mine was the only large property operating. The vast Cook estate, comprising about 20,000 acres, and embracing several mines of known value, was knowu then and had heen idle for many years.

Recently the Cook estate passed into new hands and now all is activity. The Tyro is ahout to enlarge the mill, and active work is in progress looking to the rehabilitation of the various mines on the Cook property. This work will include the huilding of roads, reopening of the mines by means of long adits and new shafts, the construction of hoists and mills at various points, or the building of one large milling plant from which railroads will diverge to the several mines, and the installation of a large electric plant to the Merced river for the purpose of generating power to run the mills, railroads and other machinery.

There is no doubt of the value of some of the mines. There are two great fissures on the property, the mother lode and the west lode. These each have several large mines. At a point in the famous Pine Tree-Josephine miue on the Mariposa estate, situated on the south side of the Merced river, these great fissures diverge. The east fissure is the mother lode, which has such distinctive features as to make it readily recognizable for many miles to the northward, at least to Carson hill in Calaveras county. These features are the occurrence of immense quantities of magnesian iron lime carhonate, known as aukerite, which is always accompanied hy that peculiar grass-green scaly mineral named by Prof. Silliman "mariposite" (an iron magnesian silicate). Through this mass is a system of reticulated quartz veins, great and small, hearing gold, the ankerite being itself gold bearing at times, as at the Mary Harrison and Louisa. In the Rawhide mine, in Tuolumne county, it was fabulously rich. The walls east and west of this great fissure called the mother lode are at times hlack slate, again diahase and often serpentine. The principal mines on the Cook estate on the mother lode are the Mary Harrison, Daliah and Louisa. The west lode is a clean, well defined fissure in hlack slate, being usually accompanied by a light gray dyke rock. The vein is from a few inches to twelve feet and rarely twenty feet wide. The principal mines on this vein are the Tyro, not owned hy the Cook estate; the Potosi, Malvina and Malvina No. 2. A large amount of work has heen done on these mines in years gone by, and everything points to the conclusion that they are hy no means worked out. Under the improved conditions—the application of electricity, the cheapening of labor, lower cost of supplies, the use of modern explosives, together with less explosive and more successful metallurgical operations—it is believed that their working will result in success.

On the Mariposa estate, agents of the company, of whom Johu W. Mackey, John P. Jones and Alvinza Hayward are the principal owners, have been engaged in opening and sampling the numerous mines on the tract (over 40,000 acres). A five-stamp mill was erected on Missouri gulch, near the town of Mariposa, for this purpose, and hundreds of tons of rocks have heen tested. A revival of operations may be looked for in this locality also. The principal mines are the Pine Tree-Josephine, Mount Ophir, Princeton, Green's Gulch, Elizaheth and a new mine recently discovered in the vicinity of Mount Ophir.

Mendocino.

AT HOBOKEN FLATS.—Blue Lake *Advocate:* A. H. Griswold is inspecting the Granite Slide, a placer claim at Hohoken flats. A company with Mr. Fisk of San Francisco as manager has been organized to operate there and the machinery to operate the property has already been shipped.

Nevada.

THE SOUTH IDAHO.—*Union:* The stockholders of the South Idaho Company are more than pleased at the result of a crushing of five loads or ahout ten tons of ore from their mine at the Electric mill, which was cleaned up last evening. The rock yielded something over $1000 or a little over $200 per load, exclusive of sulphurets. The sulphurets are very rich and the ore is probably worth $200 per ton. The South Idaho is owned by a local company, most of whom are working men and we are never more pleased than to chronicle the success of a faithful prospector. The company intend as soon as possible to put up suitahle machinery and a small mill on their claim, and they then will he in a condition to receive some returns for the money invested. The South Idaho, as its name implies, adjoins the celehrated Idaho, (now the Maryland mine) on the south, and it is thought hy many that this location is as rich as the famous Idaho which produced over $13,000,000 in gold for its owners.

A crushing of five loads of ore at the Electric mill from the South Idaho mine gave a handsome yield of $200 per load exclusive of sulphurets.

Riverside.

PERRIS DISTRICT.—It is reported that an Eastern mining syndicate has honded the Convex mine, in the Perris district, for $20,000. The bonders will, it is said, at once begin work on the property with a view to a thorough development. A stamp mill will be one of the improvements made.

San Diego.

PICACHO MINES.—*Union:* The Picacho placer mines have produced more gold in the past thirty-five years than all the placer mines put together that are found within 100 miles of Picacho, while one gold quartz mining property alone has turned out $2,710,000 during the twelve years it run.

Sierra.

GOLD POCKETS.—*Messenger:* The successful tracking of a pocket requires considerable skill and a great deal of experience. C. M. and Asa Wilson, from eight pockets on their claim, which is known as the Twin Pocket Quartz Claim, have taken out over $3000 in less than two months. From the Golden Star Lode during the early part of the season, they realized $1200 in a short time. Ahout a month ago Messrs. Wilson and Jerome York found a pocket in Slug Canyon which paid them $189—pretty fair wages for one day's work.

The Houch hrothers are now working on their lode near the High Commission and are tracing what they think will be a big pocket.

R. Sparling, of Goodyear Bar, has proved himself to be an expert pocket hunter. During the past summer he has discovered several pockets, from one of which he took $1800.

Siskiyou.

MINING NOTES.—*Journal:* Schroeder's mine at Deadwood continues to yield good returns, and the mill is kept steadily in operation day and night. This mine is one of the best paying mining properties in this county.

At Fool's Paradise diggings near the mouth of Shasta river very rich prospects have been found in the quartz, some of the specimens almost half gold. The finds are evidently pockets, hut may lead to rich permanent ledges helow the croppings and floats.

The miners on Cherry creek are making extra preparations for the coming winter, with great hope of being ahle to secure a good supply of water, the only requirement necessary for realizing rich returns for labor performed.

F. Corhin received two mammoth hydraulic giants in Yreka recently, each weighing 1800 pounds, also a large lot of twenty-two inch pipe, to he shipped to Salmon river. Corbin & Co., have considerahle mining ground at the North Fork of Salmon river, with an ahundance of water to work all year round. A dam 180 feet long has been built across the river, and the ditch and flume therefrom are 4x5 feet in size, capahle of carrying an immense quantity of water. In case the water gets low at any time, a numher of lakes can be tapped to furnish more water above the dam. This mining property can he worked without hindrance summer or winter, as it is not over 2500 feet above sea level and is not troubled with deep snow more than we have in Yreka. All the placer ground honded and located hy Corbin & Co. is to he worked with a large force of good, practical miners, and we look for an exceedingly large output of gold dust when in successful operation.

We were shown an exceedingly rich specimen of quartz from Hungry creek recently, which does not indicate that the miners there are likely to go hungry with such quartz to handle. Gold is plainly visible all through the sample exhihited, which seems too rich to prove extensive. Another piece from the same locality showed sulphurets carrying considerahle gold.

The Empire mine at Empire creek, near Honolulu, on Klamath river, now shows a fine ledge ten feet wide, along which a tunnel is being cut for getting out the quartz as the work progresses. The quartz at present taken out averages from $7 to $8 a ton, and improves in richness, hesides hecoming softer, as the work of development progresses. The fine water power mill is kept steadily in operation day and night.

MINING NOTES.—*Journal:* The Quartz mines in Quartz Valley are paying unusually good this season, and considerable gold is realized to induce more extensive operations. The old Allen mine, owned hy Firth & Co., of San Francisco, has been opened in good shape, hy means of a machine drill, and a new quartz mill is now in course of construction. Sargent's quartz ledge is also yielding handsomely, and Abram Erno is likewise meeting with good success in crushing quartz with an arrastra.

It is currently reported that the Black Jack Blue Gravel Mining Company is likely to dispose of the hlue gravel mine in Cottonwood district, to an Eastern company making offer of purchase.

The ledge in the divide between Oro Fino and Quartz Valley, known as the Big ledge, is paying handsomely, and is three feet in width. This ledge was sold a year ago hy the executors of the Johnson estate to Whipple, Eastlick and others for $500, and has just heen houded for thirty days to a company for $5,000.

Jillson & Co., at Cottonwood, are making preparations for extensive operations during the coming winter, in working their blue gravel beds, and intend putting up a ten-stamp quartz mill for crushing the blue gravel cement from the old river beds of the Klamath.

J. R. Middlemiss, U. S. Commissioner, of Salt Lake City, who has been here lately with others in the investigation of our gold mines, has honded the hlue gravel mine at Greenhorn for thirty days, buying the dust taken out each day, to show capitalists in other localities what it pays, the water used for washing having heen pumped. This claim would yield from $1200 to $1500 a week, if plenty of water could he ohtained now as during the rainy months. The land adjoining, owned by Louis Nehrhass, has also been honded hy the same man, to be disposed of to parties desiring to invest in mines.

Shasta.

MINING NOTES.—*Democrat:* Matters at Triuity Center remain statu quo.

The rich ore hodies on the Strode claims are yielding handsomely.

At French Gulch the Gladstone is running five stamps.

The sale of the Washington has not yet been consummated.

The ditches for placer mining are all in shape and ready for work when it rains sufficiently to fill them.

At Whiskytown considerahle development work is being done on seam digging.

Samoni at the Gem Mill is putting in a new concentration plant from which great things are expected.

At Middletown B. B. Martin is ready to mill 300 tons of ore in his arrastra.

Jones & Christensen at Muletown have struck a rich streak and the little mill is cleaning up from $75 to $80 a day.

The Minnesota mill and mine are working a small force of men on rich ore.

Thos. Foster has resumed operations on the group of mines owned by him and rented the Hocket Mill on Flat Creek. The teams commenced hauling ore to the mill Mouday.

Vandevere and Billard are running their arrastra steadily. The ore averages from $18 to $20 per ton.

At Squaw Creek thirty stamps and a Huntington mill, together with the wet chlorination plant, handle the output of the Uncle Sam mine.

Mr. Ellis is still working a force of men on the Balla Kallalla.

At Quartz Hill, thirty tons of ore are being sent to the mill daily. The mill has a new roof and Morris tahles and is in good condition for winter.

At Upper Springs Jas. Sallee will commence the erection of his ten-stamp mill next week.

Alex. Ludwig is ahout to sell his large gold ledge near Igo to a party from Oregon who proposes putting it through a concentrator.

GLADSTONE MINE.—*Democrat:* The mill at the Gladstone mine has started up and will now run right along. Men are being put to work, and the mine will soon be running on its old time.

Trinity.

The Altoona company met with quite an accident a few days ago. The boilers were set in solid masonry in a cut in the mountain. A small sized landslide came down and moved the whole structure several feet. The Cornish pump and hoisting works are doing fine work. The shaft is now down 150 feet in the ore. Four levels, all at right angles, are run from seventy-five to 150 feet each in solid ore. The furnaces are in operation handling forty tons a day. The company expect six tons of quicksilver as the output, this being the minumum. The greater part of the ore runs from twenty to twenty-five per cent in murcury. The present output is only worth $4200 a day, or $126,000 a month. It is safe to predict that $110,000 of this will be profit.

ARIZONA.

PROBABLE LITIGATION.—*Times:* The English Company at Picacho, above Yuma, recently took out $500 from their mines in two hours. The great pumping plant is working successfully. This is the property just located hy Montana capitalists on the ground that it is held hy English aliens contrary to the United States mining laws. Injunctions have been served and one of the fiercest struggles over miuing property ever seen on the Pacific coast will he commenced, as hoth sides are backed by millions of capital.

AN AURIFEROUS PROPHECY.—Yuma *Sentinel:* Some sixty miles east of this city and two miles south of the Mohawk section house on the Southern Pacific Railroad can he seen a large force of men at work. This is the mining camp of Professor Howland of San Francisco. It will be remembered that last summer the Professor located in that section several miles of placer country and did considerable work on one of his many claims. Hot weather came on and work was stopped until cool weather set in. The Professor claims that in the prehistoric age of Colorado a river ran where he is now at work. He says that with the assistance of his divining rod he has traced the Colorado river hed of ancient times from its fountain head in Utah to the Gulf of California. Near the ranch of George W. Norton, in the Mohawk valley, is where it crosses the Gila river, and from that point the old channel takes a southerly course until it reaches the gulf. At the place where the Professor has his men now at work he feels positive lies buried untold wealth. He has a large number of men at work night and day sinking two double compartment shafts. They are working in shifts of eight hours. They get good wages and their money is well earned. It is the prophesy of the Professor that when the bedrock of the ancient Colorado river is reached

gold will be takea out in bucketfulls and shipped by trainloads.

CHLORIDE DISTRICT.—Under date Nov. 26th, our correspondent writes: "The mining excitement which years ago ran so high here and at Mineral Park and subsided is reviving again. A number of mills that have boea idle for years are starting up again and some new ones being built, but the center of attraction in this county now is the White Hills some thirty miles west of this."

BRITISH COLUMBIA.

A RICH POCKET.—A. L. Beaten, of the Vandall placer mine, French creek, Big Beud, arrived down this week with his pack train, which he is taking to winter quarters at Deer Park, Lower Arrow Lake, says the Kootenay *Mail* of Revelstoke. Three men took out $1500 worth of nuggets in three weeks, from a pocket, the bottom of which has not yet been reached. Six men will be employed on this mine during the winter.

NAKUSP NOTES.—J. A. Finch has thirteen men working on the Silver Roll, in the Slocan.

Ten tons of ore are brought into Silverton daily from the Alpha and Fisher Maiden.

The wagon road from the Idaho basin to the concentrator on Hamson creek, in the Slocan, is finished. The distance is five miles and the cost $6000.

The concentrator on Hamson creek one mile from Three Forks, will be in operation next month. It will cost $30,000 and has a 100-ton daily capacity.

COLORADO.

A NEW PROCESS.—Among other and many processes which have been and are being tried for the bettering of results obtained in stamp mills is one now being experimented upon by C. D. Coe of Leadville from the waste waters from the Black Hawk stamp mills. The machine used consists of a cast-iron pipe four-inch in size, through which the waste water or slimes passing down the creek are forced into a hath of quicksilver. The machine is in appearance somewhat like a kettle, with a horizontal spout, the haths being rippled. The kettles are charged with 250 pounds of quicksilver. The water is introduced in the bottom part of the kettle. By the agency of a screen, it is divided into a hundred smaller streams, and by its pressuro in the column forces itself through the mass of quicksilver. In order to recover a large percentnge of values from refractory ores, Mr. Coe found it advisable to experiment with different solutions. He has eventually obtained results which are gratifying to him at a very small cost. He claims that for free float or any other form which escapes from stamp mills, it cannot be excelled, and that when used in placer mining the method employed cannot be surpassed.

IDAHO.

AT BURKE.—*Statesman:* The Cœur d'Alene Silver & Lead Miniug Company are working a force of 200 men and are running day and night. They are taking out 10,000 tons of crude ore and shipping from 1600 to 1800 tons of concentrates per month. The outlook is poor, owing to the price of lead, and the miners and mine owners are discouraged. The Tiger mine is running day and night, employing eighty men and milling thirty tons of concentrates daily. An English syndicate has had experts there for some time investigating, and it is understood a bond has been given them on some of the properties.

Cœur d'Alene *Miner:* Of the thirty-five or forty men who have been working at the Mammoth, all were discharged with the exception of seven or eight who are retained on development work. These will continue to drive forward tunnels No. 2 and No. 3. The owners state as the reason for closing down that they cannot afford to exhaust their mine at the present prices of lead and silver. The fact that they are continuing the development of the mine indicates that they have confidence in the future.

THIRTY FEET OF ORE.—A Burke dispatch says. Another strike has been made in the Tiger mine. A few weeks ago the Tiger was a great mine, with fifteen feet of ore body. Soon thereafter the vein began to widen, and when it reached twenty-three feet the canyon was delighted. Now the Tiger has beaten all previous records. It has thirty feet of ore, ten feet of which is solid galena that will not require concentrating. An assay hy the company gives eighty per cent lead and forty-one and a half ounces of silver.

A GOLD LEEGE.—An interesting discovery is reported from Idaho City, forty miles from Boise, in the center of the old placer region known ar Boise Basin, which produced such great quantities of gold in the early days, and which still has a large output. There is a false bedrock on which the gold was found, and it has long been the theory of miners that gold existed beneath it. To test this theory, a hole was drilled through the false bedrock. It went through the sand and clay without bringing up anything of value. At a depth of about 450 feet granite was struck. On the possibility of there being a boulder strata beneath sinking was continued and in a short distance a ledge was struck heavily impregnated with iron pyrites. After boring into this for a distance of fifteen feet, it was determined to make an assay of the rock. The result is reported to have been three ounces of gold and twenty-eight ounces of silver per ton.

MINING ON THE NORTH FORK.—Lewiston *Teller:* As it looks now, considerable mining will be done next season on the North Fork of the Clearwater. Quartz and placer claims were located this year, that prospect well to encourage outlays in time and money for development and active operations.

In the desultory and promiscuous prospecting in the Clearwater basin, for thirty years past, the North Fork region has either been skipped altogether, else the hunt for mineral deposits has been superficial and hasty. This is not to be wondered at, when account is taken of the rugged character of the country drained hy the North Fork. With pack and saddle it is difficult for other than a good mountaineer to make much progress in travel. Even the best of woodsmea find this too hard a task. The only safe way to explore that region is to go up the stream in a batteau with a cargo of supplies necessary for a campaign. Under such circumstances, branches of the North Fork can be followed and exploration made of the high ridges at the headwaters of the creek. This was the method adopted by a number of parties the present year.

THE HIDDEN TREASURE.—The last cleanup at the Hidden Treasuro mino in Neal district, in Idaho, amounted to $2475, the result of one week's run in the five-stamp mill. The Mountain Home *Republican*, referring to the mine, says: "As greater depth is attained on the ledge tho ore improves in quality; the pay oro is three feet wide and is of a uniform grade. This mino, in tho near future, will prove itself to he one of the best paying properties in Idaho. The mine has already produced over $8000, and is steadily producing every day.

CŒUR D'ALENE DISTRICT.—There is nothing that could speak in stronger terms for the value of the Cœur d'Alene district as a good mining country than the fact that at the present time several mines are working successfully in the face of the low prices of silver and lead, and paying all underground employos—miners and shovelers alike—$3.50 a day.

Amoug the mines that are now operating in the Cœur d'Alenes are the Poorman, the Tiger, the Standard, tho 'Frisco, the Gem and tho Morning, while the big Bunker Hill & Sullivan would be had it not been for the strike among the employes that caused it to close its works. The well-known improved mines that are not working are the Black Bear, the Granite, the Custer, the Union, the Hunter, the Last Chance, the Sierra Nevada and the Stemwinder. There are many small mines besides and a host of them that are almost entitled to wear the name of "a mine," but which lack some development or shipping facilities, and on which work stopped when silver and lead first slumped. Some of the acknowledged mines that are now idle are good properties that were mismanaged, either in failure to keep development work sufficiently ahead to insure a good body of ore, or hy attempting to use machinery that wasted the time of the men. Nothing proves this more than the fact that during the past year mines that have been working have, even in the face of the hard times, put in more improved machinery, and those that have not done so are arranging to do it during the present winter. In other words, it has been demonstrated that even with low prices the mines of the Cœur d'Alenes can be successfully operated when good facilities are afforded and the latest improved machinery used.

MONTANA.

Inter-Mountain: The Moscow mine has been started up hy the Parrott Company after quito a longthy shut-down. A small force of men will at first be employed, but it is understood that the Parrott Company will open up this property on a large scale soon. The water will be pumped out hy the Oro Butte shaft, the adjoining claim on the west. This property was purchased some years ago hy this company and considerable high-grade ore has been shipped from it.

The Revenue Gold Mining and Milling Co. has been reorganized, with a capital stock of $1,000,000, hy John P. Alhro, Samuel Newhouse and Louis A. Dunhar. The company will work the Revenue mine, an old-time rich gold producer of Madison county, formerly under the management of R. B. Turner. The company will also probably secure the Revenue mill, which has been held for some time by Butte parties, and resume the treatment of ore by the cyanide process, this mill heing the first in the State to use this process.

THE CLINTON.—It is reported that the Clinton mine, in Park canyon, will soon be in operation again hy a new company, which will, it is said, build a concentrator at this property. The erection of a mill would be a paying proposition, it is helieved, as large hodies of copper-silver ore can be mined from the tunnel at small expense. There is an ahundant water supply in the vicinity for this purpose.

WILL RESUME OPERATIONS.—The good news has been in circulation during the past week to the effect that some of our mines and mills, which have been idle for months, would soon he started up again, says the Phillipsburg *Mail*. Upon investigation the *Mail* has found it to he a fact. The Bi-Metallic mine will be started up and the ore will he worked in the Rumsey mill, for a time at least, until things can be gotten in shape at the Bi-Metallic mill. Forty stamps will he immediately put in condition for work. It is said that it is hardly prohable that the mill will he in shape to hegin operations much hefore the first of next month. The ore from the Bi-Metallic mine will necessarily have to he hauled to the Granite tramway, when it will be transported to Rumsey hy the train. The Bi-Metallic mill will continue to run on tailings, though it is said that several changes in its construction will he made.

NEVADA.

RICH GOLD DIGGINGS.—Winnemucca *Silver State:* Near Death Valley in Tule Canyon, this State, some rich gold mines should he opened. In this canyon rich dry diggings were discovered some fifteen years ago. In 1880 a few men were at work there. They had no machines for dry washing, and did not even winnow the dirt hy tossing it up in the wind—Mexican fashion. They simply dug over the ground with picks, collecting such pieces of gold as they happened to see. In this way they made good wages in ground from two to four feet deep. Working in this rude way they fouad one nugget that weighed five pounds, and a very maay worth from $5 to $75. Pieces of gold worth about fifty cents were about the smallest saved working in this way—"hy eye." With water, or even dry washing machines, such ground should have paid immeusely. As all the placers in the great basin region are of local origin. Tule Canyon must cut one or more large and rich veins of gold-hearing quartz.

At present we hear but little about these diggings, though thore is always more or less gold coming from them, which is said to be ground out in arrastras by some of the ranchers living in the vicinity.

NEW MEXICO.

CARLISLE MINING DISTRICT.—At the Carlisle mining district, which is situated close to the eastern boundary line of Arizona, in Graut county, N. M., a mineral discovery has heen made that promises, in point of magnitude, to be a veritable bonanza. It is a large dyke through which streaks of rich ore, carrying both gold and silver, exist that average $600 to the ton.

North of Phœnix, about fifty miles, on Cave creok, large bodies of ore have been known to exist for years, hut no particular attention had heen given it until recently, owing to the belief that its value consisted mainly in the copper it carried. Recent investigation, however, demonstrates that the copper oxide and carbonates is merely a gangue for both gold and silver in paying quantities. Denver parties recently procured a bond on a group. Capital sufficient to huild a reduction plant and construct mechanical and other appliances for the economic handling of the ores has been secured to open up the claims and to enter into active operations.

OREGON.

BAKER COUNTY.—Huntington *Herald:* Tho *Union-Republican* says there is not a silver mine in Oregon. This is a mistake, frined *Republican*. What do you call the La Bellevue, Monumental, Bay Horse and several other properties in Baker county? These are not only silver-hearing lodes, hut they have proved to he rich in the precious white metal and, but for outrageous goldhug legislation, would to-day be operating profitably and giving employment to scores of hardy miners.

WASHINGTON.

TOO MUCH WATER.—The rise of three feet in the Similikameen river has put an end to plncer mining this year, says the Loomiston *Journal*. Considerable gold has been taken out, and the miners along the banks and bars have made gruh and more besides, but the exceptionally high water of the early part of the season and through August gave the patient fellows too little time in which to get their wing dams into position. With a snowfall this winter and a quick thaw next spring, there will be extensive placer operations next year on the Similikameen, hut the past season was one of the worst in the history of placer mining.

SOUTH DAKOTA.

GOLD PRODUCTION.—The Black Hills, it is estimated, have produced $100,000,000 of gold during the past eighteen years. Of this vast amount, $50,000,000 to $55,000,000 is credited to the Homestake mine alone, which is claimed to be the greatest gold mine in the world. It was sold hy the original discoverers, two Frenchmen, brothers hy the name of Manuel, to the late Senator Hearst of California, for $45,000. Its ore is low grade, running only from $2.50 to $10, hut the amount thereof is practically unlimited. The vein in places is 400 feet thick. Seven hundred men are kept husily at work night and day in its shafts, tunnels and levels. The superintendent's report for the fiscal year ending June 1, 1894, shows the total net proceeds to have been $1,489,961.18. Of this $1,373,669.35 was from hullion, $17,944.27 from concentrates and $99,350.56 from other sources. The disbursements aggregate $1,162,744.55. Of this amount $311,499.63 was paid out for labor and $181,250 in dividends to the stock holders. For the purchase of mining properties during the year $103,780 was expended. The item of taxes foots up $20,012.74; $6,403.25 represents the cost of candles, while the item of powder foots up to $38,879.67. The company started the new year with a comfortable balance of $327,216.72 cash on hand. An eight years' supply of ore was estimated to he in sight. The report applies only to the Homestake mine and mills, and does not include the Highland, Caledonia, Deadwood, Terra, Farther de Smet, and other properties which are generally included under the name Homestake. The Treadwell mine, on one of the Alaskan islands, is rated as a possihle rival to this immense property.

UTAH.

THE AJAX MINING CO.—The properties of the Ajax Mining Company, recently organized for the purpose of working the Champlain and Copperopolis, are to be equipped with modern hoisting machinery, and immediately following the putting in of the machinery, negotiations for the purchase of which are now on, the shaft of the Phœnix will he sent down another hundred feet. From that point a drift will he run into the ground of the Champlain, which is about sixty feet distant from the shaft. At present the latter property is heing worked through the Phœnix by means of a skip, and the members of the company are desirous of seeing more extensive development work done. Some very rich ore is heing taken out, and it is said that the ore hodies are rapidly increasing in size. Up to date power drills have not been used in any of the properties of the group, hut the company will at once put in an air compressor, with the necessary hoiler and engine and a full complement of drills.

NEW GOLD PROCESS.—*Tribune:* E. T. Bradford is here to revolutionize the handling of low-grade gold ores and recently visited Bingham to inquire into the characteristics of the deposits in that locality. The process is the "Pickett-Marshal gold process," and for more than a year has been subjected to rigid tests with results so gratifying that he now guarantees to save the shipper ninety-five per cent of the value of his ores as determined by fire assays. It is especially designed for the handling of silicious and oxidized ores, although it may he so adjusted as to handlo the sulphides. To determine the question as to its adaptability to tho ores in that locality, he will make tho test on carload lots in Denver, where he is handling at the present time thirty tons a day. Once demonstrated that it will apply to the low-grade gold ores of Utah, says Col. Bradford, this Territory will at once double its present productions. A superficial inspection of the ores he saw yesterday at Bingham has satisfied him of his ability to save ninety-five per cent of their contents aud shipments, for experimental purposos will begiu next week. The success of the experiment means a big plant for Salt Lake.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 27, 1894.

529,849.—CAN OPENER—Jos. Bien, S. F.
529,855.—CLOTH LAYER—E. Elossser, S. F.
529,790.—ADDING MACHINE—H. B. Martin, Chino, Cal.
529,836.—ELECTRIC RAILWAY—L. C. Pressley, S. F.
529,814.—BRIDLE BIT—R. A. Shute, San Diego, Cal.
529,875.—CAN-BODY MACHINE—W. H. Smyth, Berkeley, Cal.
529,817.—FRUIT PITTER—S. Standish, Gridley, Cal.
529,987.—TRAINING APPARATUS—S. B. Whitehead, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONDUIT ELECTRIC RAILWAY.—Leonidas C. Pressley, San Francisco, Cal. No. 529,836. Dated Nov. 27, 1894. The object of this invention is to provide a means for conveying an electrical current through completely insulated and protected conductors, which are especially adapted for use for underground conductors from which a current is to be taken for the purpose of driving cars upon railways, and my device provides for the transmission of this current from the conductor to the car at regular intervals, the current being cut off at all other times and points. It consists of a trolley rail extending in an underground conduit, near the slot, through which connection is made between the motor on the car and this rail. This trolley rail is made in independent insulated sections. An electrical conducting wire extends, in a hermetically sealed tube, parallel with the line of track, and passages are formed connecting the tube with the conduit at the junction of each two sections of the trolley rail. A rod is slidable in each of said passages, having at one end an electro magnet which, when energized, acts to draw the rod into contact with the rail, and at the other end a device whereby the contact is made between the rod and the conducting wire so that the trolley rail section may be charged therefrom, and a mechanism whereby the magnets are disengaged and the rods moved hackward after the car has passed, whereby the rod is disconnected from the conducting wire and rail and the current is cut off from the preceding section as the car enters the next section.

BRIDLE BIT.—Richard A. Shute, San Diego, Cal. No. 529,814. Dated Nov. 27, 1894. The object of this invention is to form a rigid connection between the ends of the har which passes through the horse's mouth, whether it be a rigid or jointed har, whereby the rings are prevented from pulling into the mouth of the horse from either side, and they also furnish a fulcrum through which a pull upon the reins on either side will be communicated through the body of the bit, providing a leverage against the jaw of the horse, and enabling the driver to turn him equally as well as preventing him from holding the bit hetween his teeth. It consists of a mouth bar, the outer ends of which are enlarged and have rings formed upon the ends which hold against movement, so as to he rigid with the mouth har, said rings diverging and being provided with means for attaching the driving reins, and also having the upper sides provided with slotted openings for the reception of the head stall strap.

CAN OPENER.—Joseph Bien, San Francisco, Cal. No. 529,849. Datcd Nov. 27, 1894. This invention is designed to provide an apparatus for opening cans by means of a horizontal cut made around the side of the upper portion of the can, just helow the top. It consists of a hase having a socket at one side; a standard mounted to slide in said socket having its upper end turned inward and provided with a plate or head adapted to engage the top of the can, and also provided with means for centering and holding the can; a swiveled arm movable about the common center of the can and the holder; a cutter slidable radially upon said arm and carried theroby, so that when the arm is moved around in a circle, the cutter will act to sever the metal of the can side. In conjunction with this is a hase having a series of offsets of varying diameters adapted to receive cans of different sizes.

Electrical Progress.

A New Electrical Smelting Process.

The new Taussig electrical smelting process, which is now passing through the experimental stage in Germany, gives exceptional promise, and, should its practical test prove satisfactory, it will modify recent electro-metallurgical developments, progressive as they have been, to a remarkable extent. The process consists in first reducing and smelting the ore, and then casting the metal. Both processes are carried on in a vacuum. The refraction of the air has the effect of removing all bubbles of gas or air, and the casting is thoroughly homogeneous. The apparatus consists, essentially, of a long, air-tight smelting chamber, in which the hearth inclines toward a central opening, through which the metal passes into the mold. The chamber is packed with ore and flux, or metal, as the case may be, and the furnace is lined with glazed firebricks, which so thoroughly insulate it that there is no escape of current. Within fifteen minutes of the turning on of the current the heat developed will melt pig iron, and it takes but little longer to melt Siemens-Martin steel. As no carbon is present the fused metals are almost pure; oxidation or blistering, and the deleterious effect of gases evolved are prevented by the rarefied atmosphere, and the castings produced are dense and homogeneous. The most obvious advantage claimed for this process, in the smelting of raw ores, is that it can be worked wholly by water power. This ability to dispense with fuel is a matter of great moment in mountainous and remote ore-producing districts which have abundant water but no coal. In the fusing of iron it is claimed that the operation is rapid and amenable to continuous working; that it improves the quality of the castings, and that, even where steam power is used to generate the current, it gives a saving of thirty to fifty per cent in fuel. The practical limit of the process, as at present organized, would appear to be the handling of about one and a half tons of metal in one charge, which would require a furnace or fusion channel of from thirty-six to forty feet in length. By applying to such a furnace a current of 30,000 amperes and 50 volts, or say about 2000 horse power, the entire charge of 3000 pounds can be fused and run into castings in a quarter of an hour. In the making of steel and iron castings by smelting in a Siemens-Martin regenerative furnace, 1000 to 1400 pounds of coal are burned to smelt 2000 pounds of iron. In the Taussig process, even assuming that water power is not available, and that the dynamo and air pumps must be worked by steam, it is claimed that the smelting of 2000 pounds of iron or steel can be effected by the consumption of from 720 to 800 pounds of steam coal, an economy of nearly fifty per cent in fuel. Where the steel is treated in crucibles the economy is still greater, especially if the coal used be of inferior quality. By means of this process, it is stated, pig iron containing under three per cent total carbon has been produced, and it is believed that, where desirable, the carbon limit can be brought down to that of steel. It is estimated that a plant equipped with 500 to 600 horse power, using a good quality of 48 per cent ore, can produce pig iron for $8 to $9.50 per ton, allowing $2.40 for the cost of ore. Certain plants in the South already turn out iron at a lower cost than this, but the figure can be greatly reduced where a water power is available for the generation of electric current. If this system can be put on a commercial basis, it will be most valuable for the treatment of ores in the neighborhood of water power, or even where water power exists near enough to permit of the cheap transmission of current, fuel being presumably high-priced.

An electric poultice has been invented by Mr. Snedekor, involving no novel principle, but a new and useful application of an old one. It consists of an arrangement of bad conductors covered with a fabric. By sending a current through this cataplasm it may be raised to any desired temperature, which remains constant so long as the current is allowed to pass.

Conversion of Steam Power into Electrical Power.

Some weeks ago it was announced that Nicola Tesla was perfecting a device of some kind of a revolutionary character in electrical development. It is now reported in one of our exchanges that he has inveuted what he styles an "oscillator," which directly converts steam power into electrical power without the interposition of the dynamo. In the high-pressure steam engine which he employs, said to be of simple and cheap construction, the piston action directly excites the magnets, which in turn control the very rapid vibration of the piston, and electric current is produced in quantity varying with the power of the machine, without any of the losses by friction and radiation incidental to the existing methods of combining the steam engine and the electric dynamo.

The benefits to be derived from the use of this invention, it is said, include not only a cheapening of production by the leakages thus saved, but also a considerable cheapening of the cost of plant. The total cost of production, it is expected, will be reduced one-half.

Should the expectations of this daring inventor, as thus outlined, be realized, a tremendous impetus will be given the development of electricity as a mechanical power producer, and it would also largely extend the use of electricity for light and heat, perhaps to the exclusion of all other agencies from these fields. The ideal invention among electricians, at present, is the conversion of the energy stored up in coal directly into electricity without the interposition of steam at all, and hundreds are working at the problem, though, as far as known, with no immediate prospect of success. Could the means for this direct transformation of energy be discovered, one ton of coal would do the work of seven. But while the world is waiting for the electrician to solve that momentous problem, it would not be averse to the adoption of an improvement which cuts down coal bills only one-half instead of six-sevenths.

Greatest Inroads of the Motor.

It is said that the two fields in which the electric motor has of late made greatest inroads are those of mining and of iron manufactures, and that in these the developments compare in importance, if not in magnitude, with the advances in electric railroading. In mining there is a great range of application, including underground tramways, elevators, pumps, ventilators, drills, coal cutters, etc., and all branches are being actively exploited. A large quantity of American electrical mining apparatus finds its way to South Africa, and a brisk demand is now springing up in the eastern world. In iron and steel works throughout this country the resort to electrical power is remarkable. Large numbers of them use electrical cranes, and electrical power distribution plants may be found in the great manufacturing plants of the country.

Small electric batteries, weighing about half a pound, will probably soon be added to the equipment of the German soldier. The current will light a small lamp, which may be fixed in the helmet when night work has to be done, and the device will also be useful to men employed about powder magazines.

In Australia horses and cattle are now branded by electricity from storage batteries. The temperature is uniform and the brand safe and artistic.

Spokane, Wash., proposes to invest $40,000 in a 200-light plant.

OUR PIPE IS FOR SALE.

For Hydraulic Mining and Irrigation Purposes Our Sheet Iron and Sheet Steel Riveted Water Pipe Is Unexcelled.
We Have Also a Large Line of the MATHESON JOINT (Lap-Welded) Pipe, for Which We Are Agents.
Our Prices Are Low; Our Pipe Is Superior, and We Want More Business. May We Quote You Prices?

PIPE FITTINGS, TOO.

RISDON IRON WORKS,

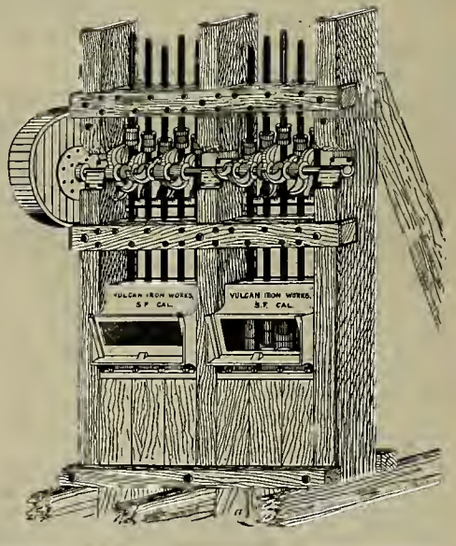
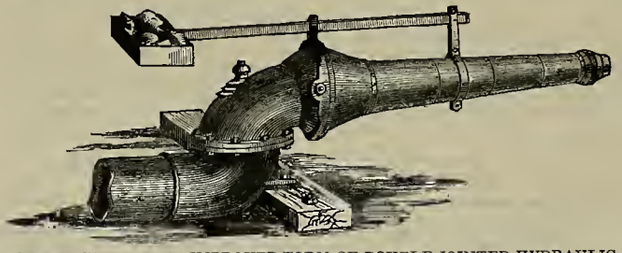
Vulcan Iron Works,
135 to 145 Fremont Street, San Francisco, Cal.



IMPROVED FORM OF HYDRAULIC GIANTS.



The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS, 42 Fremont St., San Francisco.

NEW METHODS. STORAGE BATTERIES. NEW RESULTS.

THE HOUGH STORAGE BATTERY opens a new era in electrical development. We are now prepared to fill orders for complete plants for lighting or power. Residence lighting now an economical success. Stores, warehouses, mines, mills or street railways at reduced prices. Estimates furnished. Correspondence solicited.

EUREKA ELECTRIC CO.,
42 SPEAR STREET..... SAN FRANCISCO, CAL

Practical Information.

The Efficiency of Centrifugal Pumps.

The results of some experiments on the efficiency of centrifugal pumps recently made on the Continent have been published in the *Mechanics' World*, and are of interest as indicating how frequently the conclusions arrived at theoretically require modification in practice. The design of the pump was such that the discharge through the wheel casing was taken through a narrow orifice extending around the entire circumference of the casing. This orifice gradually widened outward, to allow the water to arrive without shock in a spiral collector surrounding the pump and leading into the discharge pipe. The width of the orifice was such as to give the required flow at the velocity due to the head against the pump, with an allowance of 0.6 for contraction. The maximum mechanical efficiency of the pump was found to be only fifty-eight per cent, and occurred only with the greatest flow—about 5.4 gallons. The maximum efficiency for any given rate of delivery occurred when the lift was between fifty and sixty feet. Another pump was constructed after these trials, in which the form of the blades and of the casing was altered from that first adopted, and with this pump an efficiency of sixty-five per cent was obtained, with a discharge of 6.6 gallons under a head af 65.6 feet, and an efficiency of sixty-eight per cent with a discharge of 7.8 gallons under a head of 32.8 feet.

THE latest engineering scheme relative to the Panama Canal is that put forth by M. Bartissol, who proposes to get along with four locks—two at each end of a central level only seventy-five feet above the ocean—instead of the old plan of several levels, and from eight to ten locks between 122 and 175 feet above the sea. As this would involve an increased amount of rock and soil cutting, he proposes to dispose of the extra material thus excavated by constructing a thirteen foot tunnel, some 30,000 feet in length, through which the debris will be washed, water for which purpose to be brought through an open channel from a dam on the Chagres river—that is, there would be allowed a fall of about one foot to every 1000 of length, the current filling the tunnel to a height of some ten feet, a flow of ten feet per second, it is estimated, being thus secured, which would discharge 1,000,000 cubic meters daily; 100 shafts cut into this tunnel would empty into it only about 40,000 cubic meters of solid material in twenty-four hours, so that only about four per cent of the discharged mixture would be earth or stone. This method of removing debris, it is further remarked, has already been tried on a much smaller scale at the Isthmus and elsewhere.

THOMAS SMYTH of Fredericktown, Mo., has this idea: If shingle nails were stuck into a strip of paper, crosswise, as pins are arranged in a paper of pins, and this strip were reeled and carried in the pocket, much time could be saved in driving nails when a man was shingling a roof. The gain would be in not having to fumble about so much to straighten the nail up before driving, and in not having to carry the hand back to the pocket each time. He thinks the work of inserting the nails in the strip could be done by machinery. If anybody sees money in this idea, Mr. Smyth would be willing to sell it.

METALS may be given a soft bronze color by applying with a brush a mixture of bloodstone and graphite. The antique green effects often seen are produced by dipping the metal into a solution of salt, cream of tartar, acetate of copper, soda and vinegar.

HIRAM S. MAXIM'S flying machine is the strongest moving thing for its weight in existence. Its engine and boiler together weigh only a little over five pounds for every horse power developed. An ordinary locomotive weighs over 100 pounds to the horse power, a light yacht engine about the same, a bird twenty pounds, and a good draught horse from 1500 to 2000 pounds.

THERE is a diversity of opinion here and abroad in regard to the commercial value of electric storage batteries. They are considered successful in Europe, while the opposite view is generally held in this country. The reason of this is probably that on the other side, where people are more conservative, the batteries are given a better chance and too much is not expected of them. Here we drive them too hard on account of the keen business competition. A storage battery cannot be worked continually at its rated capacity and live.

A VERY clever device to prevent accidental poisoning by taking medicine from the wrong bottle is worth mentioning for its very simplicity. A small bell is attached to the cork of the poison bottle and rings at the slightest motion. As a considerable number of deaths each year are due to this very cause, the adoption of this little safeguard might prove very valuable.

A LENS, which will be when finished the largest in the world, is now being cast at Jena, Germany. It is an objective for an astronomical telescope and will be 43½ inches in diameter, about five inches greater than that at the Lick observatory. In its rough state, before grinding, it weighs just a ton, and will cost, it is estimated, about $75,000.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 6, 1894.

Lower and lower goes the price of silver, the latest quotation being almost to the lowest notch reached on the 23d of last February, when it fell to 59¾. The silver market bas been in a state of collapse during the week in London, tbe cause being ascribed to tbs recent large purchases by Japan of war material, for whicb Japan is said to be creating bills on the East, thus diminishing otber forms of remitting. In this country the President's message, where be recommends the extension of the bank currency system and altogetber ignores the silver question, is considered to add largely to the depression. It is a long lane, but it has a turn and the white metal will yet prevail in price.

New York Prices.

NEW YORK, Dec. 6.—Following are tbe closing prices for the week:

ANNUAL MEETING.—THE REGULAR ANNUAL meeting of the stockholders of the Gould & Curry Mining Company will be held at the office of the company, room 69, Nevada block, 309 Montgomery street, San Francisco, Cal., on MONDAY, the 17th day of December, 1894, at the hour of 1 P. M., for the purpose of electing a Board of Trustees to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, December 14, at 3 P. M. ALFRED K. DURBROW, Sec.

Mining Share Market.

SAN FRANCISCO, Dec. 6, 1894.

Matters on tbe Comstock are looking up, but tbat is of little import to Pine street, where matters are looking down, there being little business and a general decline during tbe week. It has become a good deal of a tencent business, and in size bears the same relation to former transactions that a sardine does to a whale. The moment a stock goes up a few cents, some of those wbo "despise not the day of small tbings" let go for tbe few dollars in sight, and down it goes again. Tbe Con. Va. bas paid a 25c-per-share dividend, amounting to $54,000, tbe first since August, '91. Since its consolidation witb the California, the company has paid 37 dividends, amounting to $3,682,000. Before that tbe California paid 34 dividends, amounting to $31,320,000, and the Con. Va. 53, amounting to $42,930,000. Tbe two mines to date have paid 124 dividends, aggregating $77,932,000.

The Bodie-Standard Con. will pay its 86th dividend on the 20th.

The following shows the cash balances of some of the mining companies last Monday:

Alpha	$3,379	Julia	$105
Alta	881	Kentuck	1,137
Andes	11,601	Lady Wash'n	2,756
Belchsr	20,879	Mono	102
Best & Belcher	2,405	Mexican	3,466
Bullion	8,692	Nevada Queen	866
Bulwer	1,365	Occidental	502
Bodis	41,507	Ophir	6,744
Caledonia	4,735	Overman	2,732
Challenge	331	Potosi	8,849
Chollar	11,575	Savage	583
Con. New York	1,603	Scorpion	1,681
Confidence	1,874	Seg. Belcher	2,701
Con. New York	2,368	Silver Hill	859
Con. Cal	175,495	Sierra Nevada	11,615
Crown Point	11,420	Standard Con	61,070
E. Sierra Nevada	238	Syndicate	894
Exchequer	3,824	Union Con	3,839
Gould & Curry	7,566	Utah	3,451
Hale & Norcross	7,591		

The indebtedness of other companies on tbat date is reported as follows:

Commonwealth	$14,667	North Belle Isle	$3,348
Grand Prizs	763	N. Commonwsalth	28,807
Navajo	365		

The pay rolls of tbe Comstock corporations for November amounted to $80,817.60.

Coast Industrial Notes.

—Tbe Joshua Hendy Machine works have bought tbe plant of the Vallejo, Cal., Electric Light Co.

—The Street Railway and Electric Light Company of Vancouver, B. C., has been sold to an English syndicate.

—The Chino ranch, San Bernardino county, 41,000 acres, has been sold to Charles Philipps, of San Luis Obispo, for $1,500,000.

—A cable from Point Reyes to the Farallones is urged. The distance is eighteen miles; the cost would be about $1500 a mile. It is necessary and should be built at once.

—A grain dealer in Baker City, Or., is holding a million pounds of grain, including fifty tons of wheat, believing that an increase of price is certain. He is still purchasing.

—The big South Gila, Arizona, canal, on which balf a million dollars bave been expended, is expected to revive shortly. Bonds are now in New York witb good prospects of being taken.

—A well in Adams canyon, Ventura county, belonging to the Union Oil Company, since it was put down four years ago bas produced over 325,000 barrels of oil, netting the company $43,000.

—A ship loaded with flour from Wasbington will soon leave Seattle for Japan. It is also probable that anotber ship loaded witb tbe products of that State will leave Seattle for Central America before long.

—All the canneries on Puget sound and tbe Columbia river bave closed down for the winter. Tbe catcb this year is greater tban that of any year previous. The market is good and most of tbe canneries bave made money.

—Tbe Crocker Estate Company bas a contract witb Eastern people to plant 2000 acres at Merced in sugar beets. Dr. Koebig has agreed to put up a $100,000 beet-sugar factory at Merced to utilize tbe beets. It is estimated that the beet crop tbe first year will be worth $84,000.

—Tbe work on tbe first section of the canal being built by the California Waterworks and Irrigation Company in Inyo county, is progressing favorably. Frederick Stock, Chief Commissioner, has received an offer for tbe purchase of 6000 acres of the company's land at $10 per acre.

—Tbe Fresno Milling Co. bas brought suit against the State to recover $490,000, which tbe plaintiff alleges is due it for damages resulting from the destruction of its water power by the State authorities. Tbe complaint alleges tbat the State filled in tbe company's ditch.

—Tbe Kings River Lumber Co. bas a large order from Germany to get out sequoia lumber for lead pencils. It is said tbat wood suitable for lead pencils is practically exbausted in otber parts of tbe world and tbat California stock will be largely drawn upon for this purpose in the future.

—An English syndicate has contracted to build the Fraser Valley & Burrard Inlet railway, fifty-one miles long, from Sumas, Wash., to Vancouver, B. C., providing tbe city of Vancouver gives tbe promised subsidy of $550,000 and grants an extension of one year's time, or to December 31, 1895, in whicb to build tbe road.

—Tbe following companies have filed articles of incorporation:

California Paint Company. Principal place of business, Los Angeles. Capital stock, $20,000, with tbe following directors: G. S. Foster, Colin Shanks, George F. Lott, William R. Bentley, Los Angeles; Ferd K. Rule, Pasadena.

California Shoe Company. Principal place of business, Oakland. Capital stock, $5000, with the following directors: A. L. Bryan, Napa; O. J. Cline, M. S. Hewes, Oakland; T. M. Earl, Anita Earl, San Francisco.

American Watch Company. Principal place of business, San Francisco. Capital stock, $1,000,000, witb tbe following directors: Cbarles Bovone, Percie H. Coward, A. H. Ste Marie, F. Spangenberg and G. DeLuca, San Francisco.

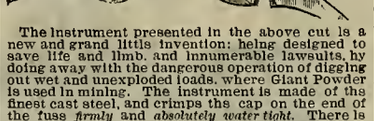
GIANT POWDER FUSE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention: being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads, where Giant Powder is used in mining. The instrument is made of the finest cast steel, and crimps the cap on the end of the fuse *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. **Price 75c. each.**

DELINQUENT SALE NOTICE.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the 26th day of October, 1894, the several amounts set opposite the names of the respective shareholders, as follows:

	No. Certificate.	No. Shares.	Amount.
W. T. Rohinson	7	25,000	$1,250 00

And in accordance with law, and an order from the Board of Directors, made on the 26th day of October, 1894, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Room 55, No. 309 Montgomery street, San Francisco, California, on THURSDAY, the 27th day of December, 1894, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. STADTFELD, JR., Secretary.

Office, Room 55, No. 309 Montgomery street, San Francisco, California.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), tbis agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many tbousands, to wbom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered tbe complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

Price $5.00 postpaid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

San Francisco, Cal.

GLADSTONE MINING COMPANY, FRENCH GULCH, Shasta Co., Cal.,
C. J. Clark, M. E., Gen'l, Supt. Dec. 12, 1891.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

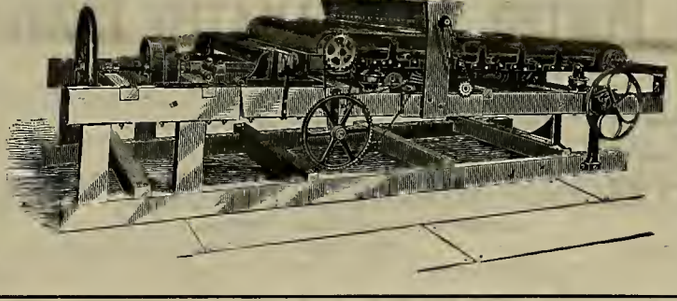
NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 24. SAN FRANCISCO, SATURDAY, DECEMBER 15, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Magnetite, Etc., in Black Sand.

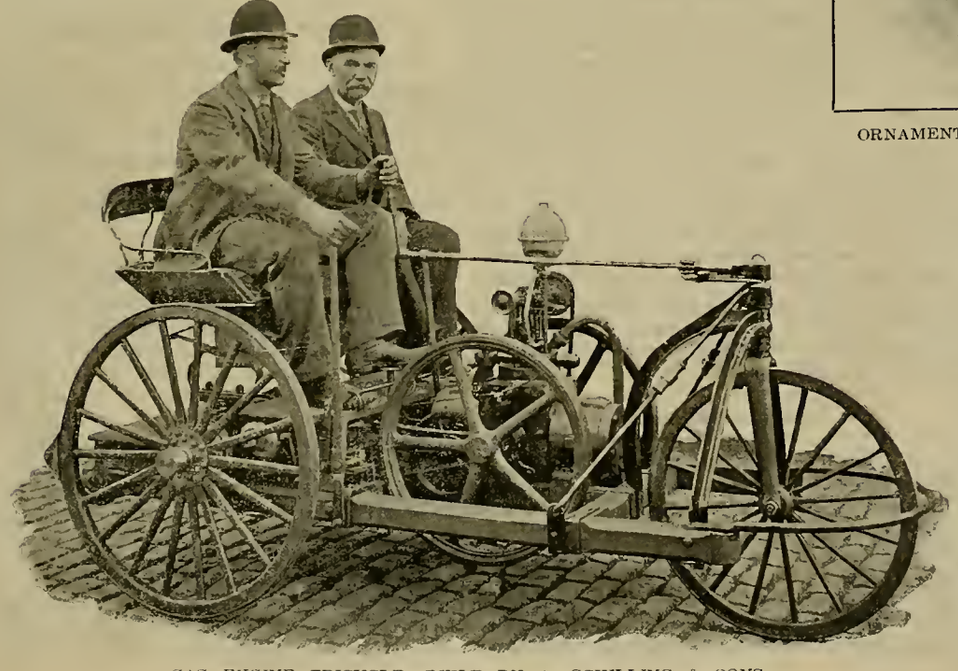
In this issue appears the third and last installment of the article on the gold-bearing sands of California, written by Mr. J. A. Edman. More than ordinary interest is shown in this subject, as evinced by the letters received at this office from all parts of the coast. A portion of these letters refer to the magnetic iron in the black sand and its commercial value. Efforts have been made from time to time to practically demonstrate such value. A large percentage—nearly one-half—of the whole production of iron in Japan is derived from treatment of the magnetic sand, and repeated analyses of the black sand on the California coast shows that it contains from 15 to 50 per cent of magnetite. Magnetite or magnetic oxide of iron, when pure, contains 72 per cent of iron. It is the most important of the ores of iron, and from it, with charcoal as fuel, are produced the finest kinds of iron and steel.

In connection with this may be mentioned a native alloy found in the black sand and sea-beach gold at Gold Bluff and other places on the California and Oregon coast. It occurs in thin scales about one-fiftieth of an inch in diameter, resembling nickel in color. It is strongly magnetic. Its specific gravity is 18. It is composed, in 100 parts, of platinum, 48; osmiridium, 44; iron, 6; indeterminate, 2. This alloy, so far as known, has not as yet been discovered in place. Its geological home is inferred to be in the peridotite and serpentine rocks.

Gas Engine Tricycle.

Verily, the field of usefulness formerly held by the horse is narrowing daily. To steam, electricity and the ubiquitous bicycle comes an ally in the form of explosive gas, so cunningly applied to the propulsion of vehicles as to threaten his utter rout. The accompanying illustration shows the latest improvement in adapting the gas engine to the running of wagons on ordinary roads. This tricycle is propelled by a 2 H. P. Golden Gate balanced gas engine. It has been tested on the streets of the city under varying conditions as to grade and roadway, and has proved in every instance satisfactory, being easy to control as regards starting, regulating speed, turning, stopping, etc.

The machine is calculated to carry three persons on the single broad seat, though operated by one, with surplus power sufficient to trail one or two buggies or a loaded wagon, according to the character of the road. It carries twelve hours' supply of gasoline, or two and one-half gallons, and can easily attain a speed of from ten to twelve miles per hour on favorable ground. Being geared in such a manner that the movement of alever increases or decreases the speed enables the driver to climb grades of considerable pitch. It is claimed to be perfectly safe and is simple in construction, the design of the inventor being to have as few pieces and parts as possible. The wheels and frame supporting the engine are strong and the entire machine is constructed in the most substantial manner, as if intended to withstand hard usage. It was built on an order from a gentlemen in Santa Maria, California, by A. Schilling & Sons, 211-213 Main street, manufacturers of the Golden Gate gas engine.



GAS ENGINE TRICYCLE, BUILT BY A. SCHILLING & SONS.

AUSTRALIA, Africa and the Phillippine Islands being big gold producers, another quarter of the world is heard from. It is said that Corea, the present bone of contention between China and Japan, is rich in gold, and that the ignorant and untrained Coreans have for years been digging out gold with soft iron instruments, detaching the decomposed quartz and crushing it by rocking boulders on it. If one-half reported is so, Corea's gold yield could be made an important factor in the world's annual gold output.

ORNAMENTAL ARC LAMP FOR INCANDESCENT CIRCUITS.

Ornamental Arc Lamp for Incandescent Circuits.

Above is illustrated an ornamental arc lamp for incandescent circuits, made by the Electric Construction and Supply Company, 18 Cortlandt street, New York City, constituting a handsome addition to the fittings of a room. The mechanism of the lamp is so simple as to obviate annoyance in daily—or nightly—use. They burn from 7 to 14 hours, have universal carbon holders with a range of $\frac{5}{16}$ to $\frac{5}{8}$ of an inch, and hung in an office constitute a thing of beauty and a joy for—a long time.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 378-379.

A BILL has passed both houses of Congress authorizing the entry of land for gravel pits and reservoir purposes, and granting right of way for pipe lines. Under this law any citizen or ditch or water company may buy lands for reservoir purposes, not to exceed 160 acres of unoccupied lands, at not less than $2 per acre. When lands so purchased are in a mining district they are considered mineral lands, and the patents do not authorize the purchasers to extract mineral therefrom, but reserves it to the United States. Any State, county or district organization organized under the laws of a State or Territory may apply for any of the storage reservoir sites not reserved by the United States, situated on unentered public lands, for storage of water for irrigation, mining or other purposes, and this land shall be set aside for that purpose. Non-use of such land for two years constitutes forfeiture. The land must not be within the limits of any public park, or military or Indian reservation.

Another Unjust Ruling.

Extended reference was made in these columns some months ago to the case of the Manzanita mine, and at the recent convention of the California Miners' Association the subject was cited to illustrate the flagrant injustice of the Interior Department in awarding perjured applicants an actual mine in Colusa county, on the unproved claim that it was "agricultural land." During the week as outrageous an abrogation of justice and equity has transpired in the denial by the Secretary of the Interior of a motion for a review in the case of the Duffy quartz mining claim in the Stockton district, on purely technical grounds. In this case, as in that of the Manzanita, it was proved beyond a reasonable doubt that the land was mineral; that the claim was a valuable one; that over $10,000 worth of gold was taken out in the last eighteen months, but despite all this the Department ruled squarely against the facts.

It is because of these long-continued, disbonest rulings that the miners of this State and the entire coast are moving in the matter of making legislation that will give them at least a portion of the rights enjoyed by others before the law; rights that now seem to be denied them, not only by the law itself, but by the strained and biased rulings of officials who, by the irony of circumstance, find themselves in a position to wreak wrong, without present hope of redress on the part of those who have long suffered such wrongs in silence.

Mining Machinery Trade.

Improved methods of mining have called for improved styles of machinery and the rapid development of that industry, or, rather, the awakened interest in gold mining has occasioned inquiry for machinery embodying the most economical processes. The opportunity for the sale of United States mining machinery in other American republics is not fully embraced. European manufacturers of mining machinery have made great efforts to establish trade relations with Mexico, Central and South America, and naturally have influence and control in Australasia and Africa. Eastern manufacturers have sent representatives to the other American republics, Cincinnati and Cleveland men being particularly zealous. In such manufacture California and San Francisco cannot afford to fall behind. The business exists, but what is worth having is worth asking for. The importance of this city as an industrial center suggests the policy of securing this trade, and in this regard it is in order to point out the desirability of co-operation. Such men as President Diaz of Mexico favor an international exposition of mining and other machinery in the City of Mexico. It is believed that such an exhibition repeated in the commercial centers of other of our sister republics, under the auspices of the several governments and the manufacturers of American machinery would broaden the market and be of mutual advantage.

The president of one of the largest companies engaged in the manufacture of mining machinery recently told the writer that had it not been for orders from Mexico he would have been obliged to close his works last July. This illustrates the relative importance of such a market.

Already is felt the good effects of the Santiago exposition, and with co-operation and concentration of effort valuable business that now goes to England could be regained and retained at home.

The programme is an extensive one. It comprises the meeting of manufacturers, the settlement of many preliminaries, and involves a certain amount of politics and legislation, including the restoration of reciprocity treaties, but that intelligent effort in the direction outlined would be of commercial benefit must be manifest to those who have given the subject the most casual notice.

Patent Law Changes.

It is intended, if possible, during the present session of Congress to have passed an amendment of Sec. 4887 of the Revised Statutes, limiting the validity of a domestic patent to the life of a foreign patent. Patent Commissioner Seymour sees no reason why an American patent should not stand upon its own feet and give the same privileges as if foreign patents had not been granted upon the same article. The original purpose of the section was to deprive foreigners who had first obtained a patent abroad from extending their monopoly in the United States beyond the expiration of the foreign patent, to the disadvantage of American manufacturers and consumers, but this feature of the patent laws has become of secondary importance to the effect of the section upon Americans who have obtained patents abroad, and have found their privileges under the American patent laws abridged by the early expiration of the foreign patent. It is thought best that the patentee be required to take out his patent within a short and reasonable time in all the countries in which he desires a patent, and thus prevent his extending his monopoly over a series of terms in different countries, by seeking a patent in the United States or elsewhere long after it had been granted in another country.

A Plan to Impound Debris.

At a meeting of the Executive Committee of the State Miners' Association last Monday night, A. H. Rose, State Commissioner of Public Works, made a report estimating the cost of constructing canals, dams and embankments on the Sacramento, Yuba and Bear rivers to carry the debris thence into the basin of the American river, on the east side of the Sacramento, between the Bear and American rivers, comprising an area capable of holding 1,700,000,000 cubic yards of debris, when filled fifteen feet in depth, which was deemed ample for all possible debris from hydraulic mines in the region embraced for twenty-five years, and would obviate the necessity for building individual impounding dams. Mr. Rose estimates that the work would cost $1,689,749, Congress to make the necessary appropriation; were that withheld, the land in question to be condemned by the State, and the work done by State aid. The proposed dam would be built at Daguerre point, ten miles above Marysville, to retain the heavier matter, the lighter to be carried by canals to the basin. The subject was taken under advisement. In accordance with a suggestion from W. W. Stow, a committee consisting of Messrs. Ricketts, Yale, Wright, Loftus and Hoffman was appointed to confer with Messrs. Mills and Herrin, of the S. P. Co., regarding mineral lands within the lieu railroad grants. The Committee on Protection of Mineral Lands from Railroad Grants made report that in California there are 1,146,500 acres unpatented land, for about half of which patents are pending, and that they had telegraphed the Secretary of the Interior asking that no patents be issued to the railroad company until their side of the case had been presented.

The Suspension of Assessments.

The attention of those who have not yet secured the benefit of the Suspension Act for '94 is directed to the fact that only about two weeks remain, and that by the 31st of this month the claimant or claimants of any mining location, in order to secure the benefits of this act, shall cause to be recorded in the office where the location notice or certificate is filed a notice that he or they intend to hold and work said claim. By so doing they will be exempt from being required to do $100 worth of labor or improvements for the year.

In answer to several inquiries received during the week it is to be noted that the notice must be *recorded*. It will not do to simply "file" it. In some of the counties of this State the clerk or recorder good naturedly makes no charge, and that is in direct line with the idea of the exemption, but if he demands his regular fee it must be paid. It is not necessary to have it acknowledged before a notary. The following, in the absence of anything better, will be sufficient:

NOTICE.

To Whom It May Concern:—Notice is hereby given that .....the undersigned, owner..and holder.. of the..... .....mining claim.., situated in the.....mining district, in the county of....., State of..... being desirous of taking advantage of the Act of Congress, entitled "An Act to Amend Section 2324 of the Revised Statutes of the United States," relating to mining claims, approved July 18th, 1894, do hereby declare that....in good faith intend to hold and work said mining claim..

Witness.....hand.. at....., County of....., State of....., this..... .....day of....., 1894.

Signed, ...
.....
.....

Cleaning Gold Off Copper Plates.

To free copper plates from gold they may be put over a charcoal, coal or coke fire, and slowly evaporate the quicksilver off them. Where admissible, the fireplace of a spare boiler can be utilized, using a thin red fire. After the entire evaporation of the quicksilver the plates should be slowly cooled, rubbed with muriatic acid and put in a damp place over night, then rubbed with a solution of sal ammoniac and saltpeter, and again heated slowly over a red fire. They must not be allowed to get red hot; when the proper degree of heat is reached the gold scale will rise in blisters, when the plates should be taken from the fire and the gold scraped off. Any part of the plate on which the gold has not blistered should be re-rubbed with the solution and again fired.

The gold scales should be collected in an earthen dish and covered with nitric acid, till all the copper is dissolved, when the gold can be smelted in the usual way, but after it is melted corrosive sublimate should be put in the crucible till a blue flame ceases to be given off.

A GOOD CHRISTMAS PRESENT to your friend would be a year's subscription to the MINING AND SCIENTIFIC PRESS.

Concentrates.

MONTANA expects to show a gold production uggregating $5,000,000 in '94.

THE Angels *Echo* says the owners of the Smadeke mine have refused $350,000 for it.

THE United States Treasurer figures the nation's gold yield for '94 at $43,000,000.

THE Cerbat gold mine, Mohave Co., Arizonu, is reported bonded to Ohio men for $250,000.

THE Bi-Metallic assay office at Phillipsburg, Montana, was destroyed by fire last Saturdny.

THE United Verde, Arizona, copper mines are now producing 2,000,000 pounds of copper monthly.

A TEN-STAMP MILL will be built by Mr. Mallows on the Golden Shuft claim at Dutch Flat, Cal.

THE James ten-stamp mill in Pioneer district, Amador Co., was totally destroyed hy fire lnst week.

THERE are 360 stamps dropping at the Treadwell mine, Alaska, working 216,000 tons of ore a week.

THE Elephant and Huffman hydraulic mines near Volcano, Amador Co., report good returns this month.

THE railroad which W. A. Clark recently built to his Arizona mines cost over $400,000 and is thirty miles long.

THE C. O. D. silver mine, sixteen miles from Kingman, Arizona, has been bonded to San Francisco men for $75,000.

THE Calumet and Hecla copper mines have paid a dividend of $5 per share, making a total of $42,500,000 paid to date.

THE *Transcript* reports the Home Mining Co., near Nevada City, to have struck rock worth $1000 n ton and plenty of it.

THE Redding *Free Press* says that the lessees of the Niagara mine took out over $500 in one pan of decomposed ore recently.

C. D. LANE has bought the Mayflower mine at Canada Hill, Nevada Co., from the Miners' Foundry, paying $50,000 therefor.

THE Colon mine, located near Triuidad, Sonora, recently owned by Messrs. Olea, has been sold to an American compauy for $200,000 cash.

THE Colon mine and the Canavau mine, in Sonora, Mexico, have been sold to American parties, the forner for $200,000, and the latter for $90,000.

THE Excelsior Water and Mining Co. at Smartsville, Nevada Co., has finished a series of dams through its worked-out claims to corral the debris.

THE Idaho M. Co., composed of Salt Lake men, will spend $6000 in the erection of a ten-stamp mill at their mine in Pisgah district, Bingham Co., Idaho.

GLEASON & HOFF are about to put in a five-stamp mill at their gold property at Escondido, Cal., where they have developed a promising prospect.

AT Trinity Center, Trinity Co., S. P. Fillman, of the Redding Water Works, will put up a ten-stamp mill on one of the Vollmers and Sboemaker claims.

PINE VALLEY in western San Diego county is coming to the front as a gold camp. Stamp mills are beiug erected and considerable development is going ou.

ROBERT MASSON, of Loon lake, Wash., has located a mineral claim in the Huckleberry mouutains which assays 110 ounces in silver, 8% in copper and $12 in gold.

A NEW YORK syndicate will explore gold placers in Sonora. Don Lauro Aguirre has furnished a report of the exteut and richness of several gold placers in the State of Sonora.

GERMAN mineralogists have discovered that some of the gold mines worked hy ancient Romaus in central Portugal will yield a handsome profit if worked by modern methods.

MESSRS. CAILIST & CO.'s reduction works at Grass Valley have been sold out to Selby Smelting & Lend Co. at Vallejo Junction for $5000. The works are now being demolished.

MINERS arriving in Baker City, Or., for the winter from the Grande Ronde river placer mines, sixty miles away, report a very prosperous seasou and have the gold to show the results.

THE Drum Mountain Miuing Co. has incorporuted in Detroit district, Utah, with a capital stock of $1,000,000. They are all Minneapolis men. James D. Pardee, Salt Lake, is manager.

S. G. EMMONS bas broken ground for a two-foot gauge railroad from Amador to the main line at or near Carhondale. He has bought a depot site aud is ahout to let a contract to grade it.

A $500 NUGGET of pure gold has been found in the Osceola, Idaho, placers. A $1000 nugget was picked up on the same ground several years ago, and several $300 pieces have been found this season.

J. B. MCGEE, from the Bohemin mines, Jackson Co., Or., reports the Annie mine in full operntion dny and nigbt, taking out about $400 in gold per day; also that the other mines nre running in full force.

SIXTY MILES from Banning, Cal., on the desert, is the new mining camp of Langville. J. and G. W. Lang have twenty men at work mining and milling gold ore, and considerahle prospecting is being done.

THE War Eagle G. M. Co. have a rich body of ore in their property at Northfield, B. C., six miles north of the Washington State line. They figure a profit of $45,000 a month on a daily crushing of fifty tons of ore.

THE Siskiyou Quicksilver Mining Co. of West Beaver, ou Siskiyou mountain, has a force of men at work ruuning two tunnels to find a more extensive body of cinnahar before starting up their furnaces in retortiug.

GOLD has been found in the neighhorhood of Goude, the last village on the Swiss side of the Simplou road, and the laying out of mines is already in process. Hundreds of workers are going to the new Alpine El Dorado.

MINERS of Oregon have written the Executive Committee of the California Miners' Association asking for a copy of its constitution and by-laws, that they might have them in forming a similar orgnnization in that State.

IN the gold district about Pierce, Idaho, 10,000 acres of ledges and placer ground have been located this season, some especially promising free gold ledges having heen taken within the last two months. Four flume companies are now operating in that district, on Rodes creek, Oro Fino, Oro Grand and French creek, and two sawmills are being put in to furnish lumber.

THE Mobave *Miner* says the A. & P. road contemplate putting on two light draft hoats to ply hetween Needles and El Dorado Canyon, at such times as the water may be too low for the large steamers of the C. S. N. Co.

LEADVILLE'S 7000 population has douhled since the recent gold discoveries near the old carhonate camp. One report says there is a twenty-foot ledge of very rich ore in the Ibex, and thut the owuers of the mine have refused $15,000,000 for it.

THE U. S. Debris Commission is about to bring suit uguinst the North Bloomfield Co., the preliminary being a restraining injunction, the charge heing that the defendant is operating without legal permit. This will be the first suit of the kind.

AT the Lucille mine, near Plymouth, Cal., the mill is now rendy for use. Considerable new machinery hns also beeu put in. The Pioneer mill is finished, and the ten-stamp mill at the Bny State ready for crushing. A twenty-stamp mill is to be erected at the Richmoud.

IN the southwestern corner of Yavapai county, Arizona, is Eureka district on the Santa Maria river, where several veins of frec-milling gold ore havo been discovered. Ahendorf & Co., who own the Waters mine, are about to put a ten-stnmp mill on their property.

THE Anneonda Company is reported to have declared its intention to reduce the output to 6,000,000 pounds of fine copper monthly. This would amount to a reduction of nlmost one-third from wbat it has been during the past few months, when their produetion was exceedingly heavy.

A. NEUSCHWANDER, who has the horax plant thirty miles south of Kennedy, Nevada, is producing about twenty tons of refined horax a month. The marsh is proving a highly remunerative business. Borax is worth seven cents a pound, making the monthly product of the plant $2800.

GORGEOUS stories are told of the richness of the Grijalva mine on the Hassaynmpa, near Phœnix, Arizona. The ore is reported heing taken from a four-foot ledge, any that does not run $150 n ton being rejected, and the owners are said to be reveling in wealth produced from three arrastras.

THE Grant's Pass *Observer* says: The mining industry of Josephine county is fast coming up to the point of importance that has long heen anticipated. The town of Grant's Pass is completely surrounded hy mines. From every point of the compass cau be found good paying quartz and placers.

THE Wannacott Lake Milliug and Mining Company have ohtained a patent for ten quartz claims, covering the townsite of Goldeu, in Okanogan county, Wash., and adjacent lands on the northwest and south sides of same; also the land on which the stamp mill aud other company huildings are located.

CAPT. BRADFORD of Deuver has a new secret process that has got $26.40 a ton out of gold ore that the Mercur Co. of Utah could get hut $14 from. He has offered the Mercur Co. to put up a mill without a dollar of cost to them, he to he given a certain pereentage of the gold he extracts from their ore.

D. C. LANE is mining silver and lead in the Darwin district in southern Inyo, nhout twenty-five miles south of Owens lake. He hauls his ore tweuty-five miles by team to Keeler, the terminus of the railroad, and ships it from there hy rail to Selby's Smelting Works here, clearing $100 hy each operation.

CONSIDERABLE interest is taken in Utah, Colorado and elsewhere over the reported smelter combine, which is thought to include a uniform method of assaying. Ores are assayed in Colorado hy scorification; in Utah by the crueible process, and the stated intention is to adopt the former iu the interests of the combine.

THE world's output of gold has increased from 702,828 tons in 1890 to 2,217,843 tons in 1893; hut during the same period the yield per ton decreased from 13.36 to 10.09 pennyweights. It is considered the steady decrease in the yield per ton is due to the exhaustiou of the higher grade, free-milling ore near the surface.

A LARGE force of men will be employed at the Gold Valley mine, Sierra Co., this winter, sinking the large compartment shaft and getting the hoisting machinery in place; also getting out ore ready for the reduction works when completed next summer. The Extension Mining Company have completed their electric plant for the working power of the mine.

THE Carson G. and S. M. Co. hns sued the North Star Miniug Co., Nevada Co., in the U. S. Circuit Court for alleged infriugement upon its Irish-American mine, charging that the defendant has taken ores from its mine valued at $825,000. The suit grows out of an old dispute ahout the boundaries of the mine, and involves in general the same question as that between the Champion and Wyoming.

A PROMINENT Butte operator thinks the price of silver is going dowu and that copper is going down to six cents a pouud. Taking these two surmises into consideration, he thinks it is likely that an attempt will be made to reduce the rate of wages iu Butte in order to compete with the Lake Superior copper mines, in which district the rate of wages is much lower thnn in Butte and transportation rates much less.

THE Pinacate district, so long worked, and around which hangs so much legendary lore, is given fresh prominence by recent developments. The Good Hope is the most celebrated of the old mines of the district. Iu the old Spanish occupancy it was worked hy Mexicans and Indians, who carried the ore to the surface in skin hags. Ahout a year ago a Colorado company bought it. They put up a twenty-stamp mill, and the miue is uow a good paying property. The Santa Rosa, Santa Fe and Alice mines also send good reports.

THE Virginia City *Enterprise* wants Director Preston of the United States Mint Bureau to tell how he knows that the silver mines of the United States produced 60,000,000 ounces of fine silver in the fiscal year ending with June 30, '94. On this subject the Salt Lake *Tribune* says: "It is both amusing and impudent in the Director of the United States Mint to claim that the silver production of the United States for the fiscal year ending with June, 1894, amounted to 60,000,000 ounces, when everybody knows that the silver production of Colorado, which heads the list of silver States, fell off more than thirty per ceut in that period. As a matter of fact, the mines of the United Stntes never produced 60,000,000 ounces of silver in any year." A good many authorities agree in the statement that the nation's silver yield in '93 aggregated 60,000,000 ounces. It is not likely, however, that the silver output for '94 will exceed 40,000,000 ounces. Sixty-five cents an ounce seems to he the extreme limit at which the white metal can he mined and save loss.

AT Bartles precinct in Siskiyou county, Cal., in the McCloud river timher helt, and comprising a territory as large as Delaware, only five votes were cast in the Novemher election. At the polling place stands an idle sawmill, which cost $100,000; a printing office, locked up after four years' publication of a paper; a well-furnished hotel, with few customers near to patronize it; near hy a coal mine, extending over half a township; and, stretching away for twenty-five miles in any direction, a mighty forest of piue, fir and cedar timher. The existing financial depressiou has, for a time, "killed" all enterprises in the Bartles precinct, where, if money was plentiful and lumher and coal in demand, 4000 people would he husy.

THE town of Copley, twelvo miles above Redding, nnticipates a boom from the Iron Mountain improvements. Seven miles of railroad will he built from Iron Mountain to Copley. The grade, according to the survey now made, is a good one, but another survey will be made which, it is thought, will give an easier grade. The mining engineer of the English company which proposes huying the Iron Mountain property is working up dnta on railroads, hridges, mill sites and water powers. The land owned hy the new company about a mile south of Coploy will be the prohable site of the new works. The roasting of 400 tons of pyrites a day will oxidize 200 tons of sulphur a day. The Iron Mountain mill is turning out hullion high in gold.

THE report of the superintendent of the Homestnke Mining Company for the fiscal year ending July 1, 1894, shows that the net proceeds from gold bullion were $1,372,669, and from other sources $117,000, making a total of $1,489,669. In dividends there have heeu paid $181,000. The stock pays fifteen per cent every three mouths. There is sufficient gold ore in sight to keep the mill at work for eight years at its present capacity. This report touches only the Homestake mine and mills, and does not include the Highland, Deadwood Terra and other properties generally included under the name of the Homestake minc. The Uuited States now has pending a suit for $700,000 against the Homestake Mining Company for trespass on timber land.

THE new rapid drop stamp uill, Denver pattern, which is heing erected in Black Hawk, Col., above and adjoining the Peun Company's stamp mill, will be three-terraced and will be provided with automatic ore feeders, says the Central *Register-Call*. It will be so arrauged as to dump the ore on the first terrace, where it will he seized by means of an improved ore hreaker, the ore passing down to the automatic feeders on the second terrace or floor. The third terrace will contain humping tahles, with sufficient space left for the storage of tailings. The mill, although of only twenty-five stamps capacity, at the speed the stamps will drop, will have the crusbing capacity of au ordinary fifty-stamp mill. The new mill is quite an innovation over former methods used in treating milling ore of the county.

MINERS goiug into Moutana from the Cœur d'Alene report the co-operative plan of working the Morning mine a failure. According to their story, about 100 men were at work mining ore a week ago, but twenty-five have quit and the rest will leave on the first of the month. The average wages made is ahout $1 a day. All receive the same pay—miners, shovelers, carmen, timber men and all. The miners say this is unfair, because it allows inexperienced men to come in on the same terms as men who have spent their lives in the mines. They also claim that the executive committee places men in responsible positions who are totally unfit for the work they are required to do, while at the same time they draw four or five times the pay that the miners draw, simply because they are not classed among those working on the co-operative plan.

TALKING of the "Beam Process," the inventor, who bas a mill near Telluride, Col., says: "It is a carhonizing instead of a desulphurizing process. The ore is roasted in our tight muffles, and the gold is dissociated from the gangue and other matter so that when the air is admitted none of the valuahle metal is lost. The air we can absolutely control and the heat is never above 600° to 650° Fahrenheit. There is no chance of losing gold by the heat. In roasting anything that contains carhon can he used, but we prefer coal dust free from grit. The silver in the ore is saved in amalgamating and the copper is put in a condition so that when leached in hot water it has only to he precipitated. We have never made any effort to save the lead, hut know that we can take it out successfully. The mill we have heen experimenting with, employing only one man on a shift, can handle fifteen tons of dry ore and six tons of eoneentrates daily, and we have determined to our own satisfaction that we can roast any refractory ore at $1.25 per ten, including lahor and fuel."

Obituary.

IT was a surprise to many to hear of the death of Geo. H. Roe at Brooklyn, N. Y., last Monday, in the forty-third year of his age. He had been so long the embodiment of business and energy that few supposed he would suffer such untimely taking off. For fifteen years he was one of the foremost men in the electric light aud power supply business in this city, and amassed considerable wealth thereat. He was president of the Edisou Light and Power Co. and secretary of the California Light Co. Six months ago his health failed and since then he had been a dying man. The remains will be brought to this city for interment.

THE United States Debris Commission has withheld approval of the plans offered by the Gold Run Mining Co., to build a restraining dam in the North Fork of the American river. The report of Lieut. Gillette and Mr. Storey was that the canyon of the stream for twelve miles above the site of the proposed dam contained such quantities of movable debris as to preclude probability of the dam's effectiveness for the designated purpose. The Commission has recommended the applicants to amend their plans, and indicates that another site for the dam would meet with more favor.

Notes on the Gold-Bearing Black Sands of California.

NUMBER III (CONCLUDED).

Written for the MINING AND SCIENTIFIC PRESS by J. A. Edman.

The occurrence of black stream sands is not determined by any special geological horizon, nor confined to any distinct portion of each gravel deposit. While most abundant in the lower strata, they are also found in the upper beds, and frequently of great value in the surface gravels. This is strikingly illustrated in many of the bars in the lower reaches of the larger tributaries of the Sacramento river, and also in many benches, flats and valley deposits of the interior, and occurs wherever valleys or basin-like depressions, origiually filled with light material, have undergone a concentration by streams constantly changing their beds, in which case the gold with the black sand is left at or near the surface, and frequeutly becomes appareut after heavy rains. Such deposits carry the largest percentages of black sand, and generally very fine gold.

The quantity of black sauds in origiual deposits varies greatly, generally ranging from one-tenth per cent up to one per cent, probably averaging somewhat less tban one-half per cent, when reduced to tbe standard of size and gravity above mentioned. The mixed stream sand from tailings, particularly sucb as have become concentrated by running water, contain much more, frequently exceeding two per ceut. The richest mixed stream sands are found when a deep tailing deposit in a stream bed with a moderate grade bas gradually heen concentrated by running water almost to the origiual bed, with but a few feet in depth of very heavy sands remaining.

The determination of percentage should always be made, both in original gravels and tailings, by careful grading of material by means of gratings, riddles and sieves, and under water for the fiuer material. Tbc coucentratiou should always take place on apparatus in motion, like percussion or shaking tables, aud on a small scale may be done with a good rocker in the hands of au experienced person. The final conceutration for sample can be done by careful panniug in clear water, but must not be carried so far as to allow the waste of auy of the black sand. Conceutration or grading in a free flowiug stream, like a sluice, is entirely out of the qucstion.

Practically, the black sands sbould, in the operations of the gravel miner, receive the attentiou and occupy the place of concentrates with the quartz miner. During years of experiment the latter has finally become aware of their importance and value, and has shaped his operatious accordingly. Tbe time has passed for the intelligent miner or mining engineer to indulge in the customary sneer at microscopic gold, which to-day forms the bulk of the bullion product of our quartz mills. Under the new conditions of gravel miuing a fitting time has come to introduce methods for the preveution of waste and the utilization of the now existiug waste products of hydraulic miuing.

VALUES IN BLACK SAND.

The gold found in the stream sands occurs in varieties as great as the coarser gold obtained in gravel mining, in form, color and quality. While smooth, rounded and flattened grains aud scales appear, much is rough, showiug little or no abrasion. Tbe percentage of microscopic gold varies, and, taking its limit at $\frac{1}{200}$ inch diameter, may be estimated to exceed fifty per cent of gold contents. Thin scalc gold, although occurring among the sands of the lower river hars, never attains the attenuated forms of the beach gold. Apparently the cessation of attrition occurs wbeu the size of gold grain equals the average interstitial spaces of the smallest grains of sand of the deposit. The infinitely minute gold particles of the gold veius are also lacking, although diligently searched for, and their absence may be accounted for by chemical action of the solutions continually percolatiug through most deep gravel heds. Further investigations will prohahly show that most of the gold so dissolved has again been precipitated by the orgauic matter present in the hlue gravels, while the light-colored and red gravels furnisbed the irou solutions that exerted the solvent action. At present tbe pyrites iu the blue gravel carry much of the gold derived from solutions, as was noted years ago at French Corral and other places. The nodular and grauular pyrites from hlue gravel has often beeu fouud gold bearing by the writer, oue sample from a drift mine in Butte county containiug $173 per ton, with uo gold visible except under the microscope.

Gold is present in origiual stream sands, both free —that is, as distinct grains originally set free from their matrix and now met with as pure or coated—and as combined or yet enclosed iu rocky matter. The former appear on closc inspection; tbe latter require further mechanical or chemical treatment for tbeir demonstration and reduction to economic uses. The free gold often occurs coated in whole or in part by the oxides of irou and mangauese, aloue or combined with lime, alumina, magnesia and silica, which frequently form a compact shell or crust arouud the particles, reducing their specific gravity and preventing their amalgamation. Much of the loss of comparatively large gold is due to this cause. In one sample treated, eighty per cent of the free gold was thus coated by iron oxide; in another instance nearly as much with a deep hlack iron—manganese crust, removable only by griuding.*

The combined gold is found in pyrites—massive, nodular and in crystals, both hright and oxidized; also, iu limonite, in hematite and in ilmenite. Tbe frequent occurrence of the gold iu the Brazilian mines in hematite, led to its discovery in the black sands of California. Its presence in tbe ilmenite has not hefore been noted. The two latter occurrences are not common to all the stream sands investigated, but are generally confined to the oldest Tertiary deposits of metamorpbic gravels. Tbe combined gold of all kinds contributes a large portion of the gold values of our hlack sands, often reacbing eighty per ceut.

THE PLATINUM METALS.

Altbough the principal platinum producing section of California—about the Klamath river and its tributaries—bas not been accessible to the writer, platinum is found in many of the channels of Sierra and Plumas, chiefly on and adjacent to the great serpentine belt traversing these counties. It occurs in the stream sands always in small and worn grains and scales; occasionally in globular particles, and of varying purity and color. It is nearly always associated with iridium and osmiridium metals, in small quautities. Its value is not inconsiderable, as it frequently ranges above two ounces per ton; in one instance to nearly seven ounces.

Cassiterite, as wood tin and stream tiu, occurs in many samples of black sand treated, generally in small quantity; in one instance rather abundant. It would add materially to tbe value of some sands, in any general scheme for tbeir utilizatiou. It has also been found in large grains and small pebbles in some of the surface gravels of Plumas county. The collectiou and sale of stauniferous stream sands has long heen practiced by the gold miners of Australia.

Metallic copper occurs among the black sands of the north fork of tbe Feather river and its branches, in rough scales aud grains, generally with black surface; but it is uot abundant enough to be valuable. Large nuggets of copper also occur in that region.

The origiual stream sands described above have mainly been derived from the flumes and sluices of hydraulic mines. In some instances they were obtained directly from a gravel bank, for determination of percentage of hlack sand.

MIXED STREAM SANDS.

These sands are always obtaiued from tailings of gravel mines, and represent material more or less concentrated by natural causes. They form the most valuable and hitherto ueglected sources of wealth concealed in the immense bodies of waste matter accumulated in creeks and river bottoms during the last thirty years of gravel mining. The coucentratiou of tbese deposits, as hefore mentioned, has been determined by local conditions and is slight when situated in high and dry localities, when only tbe finest sediment has been removed When they occur in larger streams, exposed to the sorting action of running water, they are highly concentrated and become valuable. In addition to the minerals contained in the original stream sands, tbey also represent the waste products of gold mills discharging iu the streams adjacent. These consist chiefly of gold, both free and combined with quartz; gold amalgams of various kinds; mercury, mostly floured; limonite; pyrites; galeua; wulfenite, and various otber concentration products from mills.

In the concentration of tbese sands for sampling, a very fine or dust-like light brown sand is noted, of a specific gravity of 3 to 4, which contains much quartz gold. Concentration should cousequently not be carried far enough to remove these, but be directed to produce a sample of about 4.25 to 4.50 specific gravity. The limonites are often crusts, but generally pseudomorph after pyrites. Other sulpburets are analogous to those found in quartz mills. The galena, although worn, generally shows its cubical structure.

Metallic mercury is seldom found, except iu the close viciuity of a mine. It has generally combined with gold to a defiuite amalgam which is crystalline, in cubical and octahedral forms. Even larger grains and scales of gold escaping from placer mines, slightly amalgamated and for a loug time reposing among tailings, combine with the mercury into crystalline amalgams of a pale yellow color. All these minerals help to raise the gold contents of the mixed stream sands.

It should not be assumed that all black sauds carry gold in workable quantities. In common with ores and coucentrates, they occasionally occur barren, chiefly in tbe shallow gulches and ravines. Oftener they contain gold in small amounts up to $10 per ton. It may he set down as a fact that all the black sands from a non-volcanic, Tertiary deposit will go above that tenor and geuerally up to $50 per ton. Simple inspection with a magnifier will not determine tbe values in any instance, but may serve to approximate the free gold contents. Of necessity, the black sauds cleaned up from drift and hydraulic mining operations, from cuts and flumes, are the richest in free gold and generally range above $100 per ton, frequently reacbing $500.

* See Whitney's Auriferous Gravels, pages 390, 519 and 526.

In No. 1 considerable fine gold could be seen on close inspection; much less in Nos. 2 and 3. In all the others, excepting Nos. 9 and 16, that showed a few colors, no gold was visible to the naked eye. Numbers 3, 6, 8, 9 contained tin ore, No. 6 in same quantity. *Average weight of samples two pounds.*

Tbe ahove lots were not specially selected on account of their richness; many of them when received by the writer were stripped of all visible gold contents.

No special obstacle exists to the sampling of tailings, so far entirely neglected. The much controverted point of loss of gold in hydraulic operations can be determined only by that method. The black sands of ten tons may suffice for a small deposit; one hundred tous or more for a large one. From 100 pounds up to one ton of black sand thoroughly treated the gold conteuts could be determined with accuracy.

The methods of conceutration and extraction of the gold, although tested experimentally, can not at present be presented to tbe pubilc.

An inquiry into the relative merits and serious disadvantages of the hydraulic method of mining, as contrasted with otber modes of gold mining, ancient and modern, in connection with the evidences offered by the study of tbe black sands, must be reserved for another communication.

Meadow Valley, Cal., Nov. 21, 1894.

Saving Fine Gold.

TO THE EDITOR:—Last Octoher, in Idaho on Snake river, I heard of a chemical process for saving fine and flour gold being used in the big bend of tbe Columbia river, went there to see the workings of the system and found four claims using the cbemical process invented by Banta & Wink, of Seal Rock, Oregon. Tbe men using their boxes were taking out on an average $5 per day to the hand of gold that would not yield fifty cents per day by the common sluicing process. I made up my mind that I would fully investigate tbe process, came here to do so and am fully convinced that wbat they are using is of great benefit to the mining industry. They saturate the bottoms of their hoxes with a chemical solution which attracts every particle of free gold and it adberes to the box, even if gold is rusty or greasy. There in the black sand on the beach (where there is very little gold) it separates every particle of the gold from the sand and enables tbem to save three to five dollars per day from dirt that will not yield ten cents per day by the old sluicing process. It will save the fine flour gold that will not amalgamate with quicksilver or is too fine to sink or too rusty to save by auy process uow iu use. There are thousands of places all over the coast known to miners where there is gold in paying quantities but wbich will not amalgamate in the ordinary way, therefore cannot he worked at a profit, as every metbod now in use would be too expensive. But this chemical process of Banta & Wink will enable them to be worked; for tbe expense is nominally nothing. Next year there will be hundreds of miners on the Columbia and Snake rivers usiug this system and turning into coin thousands of dollars of fine flour gold that is lying in the sands ou tbose rivers and without it would continue to lie there.

FRED BURTON.

Seal Rock, Oregon, Dec. 1st, 1894.

MUCH of the pecuniary success of a manufacturing enterprise comes from a careful regard to wbat are called "by-products." The liquid waste from a hig rail and rod factory in Salem, Obio, has formerly gone into a stream there. It will now be caught and made into copperas, which change will not ouly yield further revenue, but also improve the quality of the water in the stream.

Early Quartz Milling in Grass Valley.

The following article of local interest, is contributed to the *Engineering and Mining Journal* by G. F. Deetkin M. E. of Auburn, Placer county:

A prominent mining man recently made the statement that in early days such a thing as concentrators were unknown. No sulphurets were saved. Even the great Idaho mine at Grass Valley was worked many years without even having a concentrator of any kind. As the writer was one of the earliest on the ground in chlorination and consequently interested in the saving by concentration of the sulphurets from the tailings of the mills, some facts on this subject may be of historical interest.

The first concentrates, or sulphurets, were saved in this State by the Chavanne brothers and William and Robert Watt; also by Mr. Fricot, at Grass Valley, and by Nelson Soggs, of the Nevada Quartz Mine, at Nevada City, in 1857. The Grass Valley mining men used the rocker for this purpose; and Soggs, at Nevada City, saved his sulphurets by the Bradford shaking tables, introduced by Mr. Ferre. These tables consisted of large copper plates, about two and a half by four feet in area, suspended on rods, and receiving a shaking motion in the direction of the water current. They did good work.

Some Cornish miners used the "tying method" of concentration, and the first stationary hard buddle, with tossing hub attachment for finishing the product, was introduced by Mr. Houk, a Cornish tin dresser.

The sulphurets saved had to pay $200 a ton to leave a profit over the expense of shipment to Swansea or Europe, and the Messrs. Chavanne and Watt, working the Rocky Bar mine near Grass Valley, had sheds stored with hundreds of tons of sulphurets, not knowing how to utilize them to advantage. Amalgamation in Chile mills and arrastra extracted but a portion of the assay value in gold.

The writer, informed of these facts, experimented at Nevada City in 1858 and 1859 with various methods of treating the sulphurets by smelting in reverberatory and blast furnace, but the want of favorable conditions, i. e., want of lead ores and cheap fuel, also fine condition of ore, prevented him from making a success of the method at the time. Chlorination finally succeeded in giving perfect results at a reasonable cost.

The sulphurets at once found a ready market, though supplies of acid and chemicals, furnished partly from the East and hauled by the bull team were very expensive. Chlorination after overcoming the difficulties of a start, has ever since 1860 maintained its supremacy over other processes. There is to this day no essential improvement on the methods used in the early days with the apparatus introduced at the time by the writer on limited supplies of sulphurets. All present advantages arise from the cheapening of supplies, enabling the operator to use them freely and to arrive at results more closely approaching assay value.

The methods of concentration were gradually improved. The convex mechanical buddle with revolving brushes supplanted the hand buddle, and in 1871 the writer found it in use at Governor Daggett's mine in Trinity County; also at the Washington mine, Mariposa County, in 1870.

Paine and Stevens' concave buddle, with self-acting distribution of the slimes by revolving distributing arms and self-raising central riffle was the next improvement, and the Eureka Company (William and Robert Watt, superintendents), and subsequently the adjoining Idaho Company at Grass Valley adapted these machines with great success at the very start of their mills in 1865. The buddles did good work, though not as economical as later improved machines, on account of the hard labor required to double and treble the concentration product previous to final work in the dolly tub. Concentration costs them twelve and a half cents per ton of ore milled in a thirty-stamp mill. Rockers at the tail end of the sluices still saved valuable material as they do behind the concentrators of the day. Hendy's shaking tables introduced by Captain Faull at the Keystone mine, Amador County, came in extensive use in 1863, and were finally succeeded by the Frue, Triumph, Woodbury and Johnston vanners, who hold the ground in California at present.

The benefit of the treatment by concentration and chlorination of the valuable pyritiferous tailings of the gold quartz mills as developed in California were later on recognized by Australia and New Zealand. Mr. G. Thurean, mining engineer and lecturer, delegate from the Bendigo gold fields of Australia, sent out here in 1877 at the instigation of Mr. Lansing, attests in his pamphlet the value of our methods and suggests their adoption. According to Mr. T. A. Rickard the concentration and chlorination plants of the California pattern are common enough there now.

Simultaneously with the improvements in concentration of the sulphurets, the quartz milling operations in California were greatly cheapened by the introduction of automatic delivery of the rock to the crushing machines through guzzlies, rockbreaker and self-feeders. The extraction of the gold was at the same time improved by the displacement of the blanket process—saving of the gold on blankets, outside of the battery and amalgamators in Attwood's amalgamators—by battery amalgamation, doing away with the labor and expense of blanket washing.

Innumerable assays of the tailings and the lower value of the concentrates since the introduction of battery amalgamation of rock of equal value from the same mine has proved the value of the change. This lowering the value in sulphurets occurs in spite of the closer elimination of the sands from the concentrates by the present concentrating machines. The amount of silica and alkaline earths, inclusive of alumina in the Idaho sulphurets of 1892, saved by the vanners, reached the lowest limit known to the writer, viz., 3.05% against 16½% by the Paine and Stevens buddle in 1870.

Water power, wherever attainable at reasonable cost, has also considerably cheapened present methods of milling through the Pelton and later on the Dodd motors.

Automatic canvas slime tables below present concentrators are still a desideratum. The usual percentage of gold saved by our best mills at present according to Mr. J. H. Hammond, M. E., is from 86 to 90% of the assay value, an improvement of from 13 to 17% on the old blanket process.

New Gold Fields in South Africa.

Although the attraction of the new gold fields in Western Australia have so far distracted attention from South Africa, says the London *Mining Journal*, that several members of the Mining Market have forsaken the old love for the new, it cannot be but that the present revival in mining enterprise will before long be stimulating new developments in South Africa. Nothing can be more mistaken than the idea that the mineral resources of the latter country are in any degree exhausted. On the Witwatersrand itself a new era is only just entered upon in the commencement of deep level mining. Though the deep level concerns have not attracted any sensational public interest, enormous sums have been expended upon their machinery equipment, and their shares are very firmly held. It is a platitude rather than a prophecy, to say that this time next year the capital value of these shares will be far in excess of what it is now. Moreover, we are likely to see a wide extension of the principle of amalgamating the outcrop properties of limited duration with deep level claims. The gigantic Simmer and Jack proposal has already been followed by several others on these lines.

Some are now awaiting the formal approval of shareholders, while others are still in process of definite arrangement. When the unprecedentedly huge hauling and crushing plants erected on these properties are once set to work, we may expect to see a new and more striking series of record outputs. But the mineral resources of South Africa are by no means confined to the Rand. Even eliminating from consideration the tin deposits of Swazieland, and the silver and copper ores of other districts, there are plenty of other gold fields which promise future importance. To commence with Matabeleland, one cannot but be struck with the business-like manner in which both capital and energy are being provided for the prospecting of that region. The comparison with the mining history of Masbonaland is certainly unfavorable to the latter. London and Johannesburg syndicates have sent up distinguished experts, and half a dozen batteries are already on the way to commence crushing. Salisbury has remained a dormant Stock Exchange; Buluwayo already begins to assume the appearance of a mining camp. The reasons for this are numerous and apparent. In the first place, Masbonaland has always been regarded as a veritable El Dorado; Mashonaland was only a make-shift for the real Promised Land. Then, again, Buluwayo is far more conveniently situated for the transport of mining material than is Salisbury. The railway to Salisbury from Beira—"the swamp railway," as it is ignominiously called—has failed to penetrate from the coast within the expected time, and seems even now to be a less satisfactory conveyance than ox-wagons and traction engines. Mr. Maund has just been complaining bitterly, not only of the time required to carry goods from Beira, but also of the frequency with which accidents happen in transport. On the other hand, the Mafeking railway has been pushed forward with the utmost rapidity and there it no difficulty in pouring all kinds of commodities into Buluwayo. On top of this there are the excellent reports forthcoming upon the Matabeleland reefs from Mr. Hammoud, Mr. Williams, and other experts now exploring the country, and the ungrudging subscription of fresh capital by the astute financiers who are directing its development. If, as is stated, the fifty per cent clause of the Chartered Company's mining law is to be abrogated in favor of conditions more favorable to the mine-owners, we may fairly look forward to the rapid establishment of a flourishing gold industry in Matabeleland. There is no doubt that payable reefs exist in Lobengula's former territory. As for Mashonaland, the crushing reports have hardly confirmed sanguine expectations, but a reduction in the mining royalty would apply to this region as well as to Matabeleland, and there have lately been reports of a rich strike in Salisbury itself. Outside the Rhodesian territory, however, one of the features of South African gold mining has been the quiet and steady developments of gold fields in the Transvaal itself, outside the Witwatersraud. The reduction of working costs by the improvement of cyanide processes and the construction or contemplation of new railways are two factors largely responsible for this. Both the Silati and Delagoa Bay lines, for instance, will do a great deal in this direction—the former for the mines in the Zoutpansberg district, and the latter for the De Kaap and other fields. At De Kaap the amalgamation of mines and the employment of electricity for power purposes are doing much to revivify the auriferous industry. The output of the Lydenburg gold fields in the first six months of this year was more than double its amount in the same period of 1893. The return from the Klerksdrop mines this year have also shown a remarkable improvement upon those of a year ago, and there is a distinct revival of mining enterprise this center, at which seemed at one time entirely deserted.

The introduction of the cyanide system is trusted to make the working of the low grade ore a success. In face of what has been accomplished on the Rand, there is certainly some excuse for sanguine anticipations in this direction. In the Southern Transvaal, upon the borders of Zululand, English, Johannesburg, and Natal syndicates are at work developing the bankct formation with the view of floating companies to take over claims upon the strength of crushing results. The State mining engineer has condemned these fields as containing too poor ore to pay working expenses, but the syndicates concerned are hopefully continuing their expenditure of capital, trusting to new processes of extraction to make up for the small content of gold. The same thing applies to the adjoining Noudweni gold fields. There are also reports of strikes of gold in Natal and the Cape Colony, of which nothing definite is known at present. It cannot be denied that this widespread activity is a hopeful sign for South Africa gold mining. The reductions obtained at the Rand mines in the treatment of low grade conglomerate is the chief elements in the direction of enterprise to the outside fields, and viewed in that light, it is hopeful of a continuous increase in the number of dividend paying mines around Johannesburg itself.

Deadwood To-Day.

Deadwood of to-day, says the *Herald*, is a straggling village of houses and shops in a gulch. The creek that tears through the town makes a noise when men are not talking politics on the bridges. Seventeen years ago the water of this stream was clear, and men could whip trout from its depths. It is red now, and when a stranger to the village stands upon the bridge he is told by the natives that if he were to wheel a wagon from bank to bank there would be gold enough on the tires of the wagon to pay his fare to Spearfish. And Spearfish is a goodly distance. "That water is colored by the waste of the Homestake mine." these same natives will say. Continuing, they will declare, "There is gold in every riffle." The town is dead, though. Its dance houses are closed, the old-time mail coach is now a feature of a show in the East, and the limbs of the trees to which the Vigilantes of old used to string their victims are moulting.

It has been discovered that microbes capable of germination exist in the ocean everywhere except at great depths. They seem to be more plentiful in the Canary, Florida and Labrador currents than elsewhere, and are not detected in the ocean bed. They are, however, plentiful at a depth of 1300 feet, and are found as far down as 3500 feet—certainly deep enough for all practical purposes. Some of these microbes are phosphorescent, and are found on the bodies of living fish.

Tell a person to take an even number of coins in one hand and an odd number in the other. Then bid him multiply the number in his right hand by an odd number, and the number in the left hand by an even. Now let him add the two products together and tell you if the total sum be even or odd. If it be even, the even number is in the right hand. If it be odd the odd number is in the left hand.

According to the Cincinnati *Commercial Gazette*, 45,277 convicts are daily employed in the United States, turning out a product valued at $28,753,999 per annum. This product is largely in a few lines of work, such as the shoe and clothing trades, necessarily tending to lower the rate of wages paid to free labor. In fact, convict labor costs only about one-third the wages given to free labor.

The scientists of a European expedition now in Ecuador have been making analyses of ashes which fell 150 miles away from Cotopaxi at the time of its last eruption. They have found them to consist mainly of feldspar, quartz, maquetite and specular iron ore. One sample yielded silver at the rate of 200 grains to the ton.

Big Trees "of California" Found Fossilized in Colorado.

Written for the MINING AND SCIENTIFIC PRESS by Prof. A. Lakes of Golden City, Col.

The California big trees, or *Sequoia gigantea*, so familiar to the dwellers on the Pacific slope, and so celebrated throughout the world, have an interesting geological history and pedigree. Not only are they, perhaps, the oldest trees now living in the world, but they date from quite an early geological time. They were among the first genuine trees, like those of the modern age, to appear on this planet, for we cannot consider as trees proper the gigantic and fantastic reeds and mosses which preceded them in the old Devonian and Carboniferous times. Those were rather gigantic plants than true trees, despite their great height and thickness. The Sequoias made their first appearance in that middle portion of the world's existence known as the Mesozoic or Middle Life era, and in that subdivision of it called the Cretaceous—an age teeming both on sea and land with strange reptilian life. The fossil remains of these trees are found scattered over the northern hemisphere, even in the rocks beneath the eternal snows of Spitzbergen, Melville island and Greenland. They are found also in the same class of rocks in Canada, Saxony, Bohemia and Belgium. In the rocks of the succeeding Tertiary or Mammalian age they are found fossilized all over the world—in Greenland, Spitzbergen, Alaska, Sitka, Colorado, the Hebrides, and down through Asia to Italy.

Though there are but two varieties of these trees now living and those confined to the Pacific coast, in those olden times there were as many as twenty-six varieties extending over the northern hemisphere from latitude 43° to 78°, and even as far south as in the Tertiary rocks of Australia. Truly, these most ancient of living trees are monuments of the great past, "survivals of the fittest" living on into the living present, and as we stand in awe before their colossal forms we may say

This was the forest primeval.

The great Reptilian age begun with dreary forests of reeds and these tall pines, probably but little frequented by the great lizards which forsook these dismal shades for the warmer swamps and beaches of the sunny coast.

With the Tertiary there is a sudden influx of trees like those of to-day, coming on like a sudden creation without any marked intermediate forms from which they could have gradually evolved. Throughout the Rocky mountains we find abundance of the fossil remains of such trees, many of them of a semi-tropical character, such as the sweet gum, persimmon, tulip tree, magnolia and others, some of which are common in California gardens to-day. With these were such common temperate zone trees as the chestnut, birch, maple, poplar, etc. Nor were such trees limited as now to the modern temperate or semi-tropical trees, for we find their fossil remains imbedded in the rocks below the snows of Greenland and in Vancouver island. The tulip tree, for example, is often found in the rocks of the arctic circle. The causes of the change of climate which brought about these changes in the habitat of this vegetation, is too abstract a matter to describe here. It seems as if the march of vegetation and tree life had been from to north and arctic zone toward the south, and as if a semi-tropical Garden of Eden had existed in the region of now perpetual snow and ice.

The rocks of Colorado of the upper Cretaceous and Tertiary periods are full of fossil wood and fossil leaves, and by the erosion of these beds we find quantities of fragments of fossil wood scattered over the prairie among the surface drift. These fossil woods doubtless belonged to the trees we have mentioned, such as oak, poplar, hickory and palmetto. Not unfrequently we find their stumps standing erect in the strata in the position in which they originally grew.

During the past summer, on my way from the gold mining region of Cripple Creek, I stopped at Horrissant station, a locality noted for its fossil trees, as well as fossil insects, leaves and fishes, imbedded in its shales.

Here, right in the heart of the granite hills, we have the relics of a small Tertiary lake represented by horizontal beds of shale and sandstone, abutting against and skirting the flanks of granite hills, which must have formed islands in the lake, or traceable up many little valleys which may have formed creeks and bays.

Around the skirts of one of these ancient granite islets, imbedded in the shale which is composed of fine volcanic material, are a number of gigantic fossil stumps—a few years ago, doubtless, rising a foot or so above the level of the meadow, but by the work of tourists and the elements now for the most part leveled with the soil. These stumps, whose diameters vary from six to fifteen feet, have the wood so wonderfully and minutely replaced by stony matter that, were it not for their great size and that on taking up a chip you feel its hardness and weight, one might pass them by as stumps of old pine trees cut down by the axe of the settler of a few years ago. The prevailing color of the wood is an ashes gray like a dry chip, but sometimes the infiltration of a little iron has almost restored the original redwood color. Not only is the wood and bark microscopically and molecularly replaced by stone, but even the minutest as well as the larger sap veins are replaced by translucent chalcedony and opal, simulating fossil gum.

One of the largest of these stumps has been unearthed down to the upper portion of its roots by some parties who contemplated sawing it up in vertical lengths and transporting it bodily to the World's Fair. But, despite their improvised machinery and stone saws, they, happily for Colorado, signally failed. They found the hard silica of the tree too hard for their stone saws, and the latter are seen still sticking in the stump as monuments of their vandalism and failure. By the grain and general appearance of the wood, despite its being turned to stone, a Californian would at once recognize it as his native redwood—a presumption which is proved by microscopic examination of fine sections of it as compared with the living redwood. The diameter of this tree as it stands about twelve feet above the bottom of the quarry is fifteen feet. In the fine-grained, paper-like shales enclosing the tree we found numerous remains of fossil insects, such as ants, grasshoppers, lantern flies, beetles, etc., and some years ago Professor Scudder discovered a perfect butterfly, the impression so exquisitely preserved that even the pattern of the colors on the wings were easily recognized. Only one or two specimens of fossil butterflies besides this have been discovered in the world. The remains of a sparrow and fresh-water fishes and shells have also been found in the same beds.

The history of the lake and its fossil remains seems to be as follows: There was in Tertiary times a lake among these granitic hills, by the side of which grew these sequoias, together with many other kinds of trees, as shown by the varieties of leaves found. Fishes inhabited its waters and insects flitted over its surface or basked on the wet mud at low water as butterflies are often seen to do nowadays by the mud of a stream. Winds blew leaves out on to the surface, which sunk to the bottom and became imbedded in the mud. Insects in various ways found a grave in its waters and a burying-place in its muddy bottom, and the great sequoias growing on the banks died of old age or by the rotting of their roots from the encroaching waters, and their stumps were entombed with the other remains. On the shores of this lake—perhaps like at Lake Mono in California—were a number of volcanic vents, which, in their periodic explosive eruptions, threw up clouds of volcanic dust and ashes which fell back in showers into the lake and contributed the material that entombed the fossil life. Gases from these eruptions may have assisted in destroying insects and birds flying over the surface of the lake. All the shales and sandstones enclosing these remains are made up of comminuted volcanic matter sometimes exceedingly fine, as of volcanic dust, sometimes coarser. We noticed on one of the hills above the petrified stumps evidences of former hot spring or geyser action, which usually accompany the last dying efforts of volcanic action. This appears to have been as in the neighboring Cripple Creek mining region—the last phase of volcanic activity such heated waters may have assisted in dissolving silver and petrifying the stumps. The lake eventually either filled up with volcanic mud or dried up, or was drained off. Erosion wore out valleys and parks in the soft shale, exposed the buried and fossilized tree trunks, and enabled us to explore the fossil fauna and flora of the locality as to the mode of fossilizing, or the petrifying process, which is often a subject of wonder. In the case of the tree stumps, after they became imbedded in the mud, they were hermetically sealed from the air, and so immediate decomposition was for a time prevented. The trees became thoroughly saturated or "waterlogged," and with the moisture came in silicious or quartzose matter permeating every cell and fiber; and, as the woody matter of the cells passed gradually away, its place was supplied, molecule for molecule, by this mineral matter till the whole tree was replaced by stone. The insects and leaves have not been so replaced by stone; only their impressions remain in the fine mud, much as the patterns of leaves are sometimes prettily made on the cement of the sidewalks of Alameda and San Francisco.

DEPOSITS of saltpeter that promise to be the most valuable in existence have been discovered in Cape Colony. They are claimed to be true potassium nitrate, which is one of the chief ingredients of gunpowder, and is worth about $80 a ton. The principal supply at present is from Chile, but the "Chile saltpeter," as it is called, has to undergo a costly chemical process before use. Nitrate of potash is found in but small quantities as a rule, as it is soluble in water, and is therefore washed out of the soil by the rain. The dryness of the South African climate is supposed to account for the richness of the latest find, which, it is stated, will reduce the price of the mineral one-half.

Mining at Ophir, Placer County.

TO THE EDITOR:—This sleepy old quartz camp seems to be on the eve of an awakening such as it has not had for years. The following mines are now running in the camp:

The Hathaway, under the superintendency of Mr. Eastwood, is employing fifteen or sixteen underground miners and is keeping ten stamps running right along. It is making no reports of rich finds, but keeps right along crushing ore and paying its men, which is about the best sign of a successful mine.

The Harrison (east extension of the old Gold Blossom), Chas. F. Reed superintendent and manager, has been incorporated as the Gold Blossom Mining Company, with a capital of $20,000, and has a fine mill in course of erection and has a large amount of ore on hand ready to be crushed. The machinery has been slow to arrive, and everything is ready for it, so all will be in ship-shape as soon as it arrives and a crew of men will be put to work. The name of Chas. F. Reed is a guarantee that there will be no fancy prospecting, but that the mine will be worked as a business proposition.

The Old Gold Blossom or Ohio.—A company of Bay capitalists have incorporated as the Chemical Gold Mining and Reduction Company and are actively engaged in getting the works in shape to use a process of their own for the reduction of the ore. Mr. Geo. L. Brown, their superintendent, is favorably impressed with the outlook, and promises to wake up the doubting Thomases by saving the gold and silver contained in the ore up to over ninety per cent of the fire assay—a feat which he proposes to accomplish by a newly obtained process in which electricity largely enters as one of the main features.

The Boulder, under C. C. Handy, superintendent, is owned in small shares by different parties who have been hampered by inadequate machinery and poor management heretofore. Mr. Handy took charge some time ago when the company's exchequer was depleted. He has not said much since, but pays the nine or ten men employed when the end of the month rolls around, which speaks for itself. I shall write about some of the idle mines and prospects later. RESIDENT.

Recent Additions to the Museum of the California State Mining Bureau.

Mr. H. S. Durden, secretary of the State Mining Bureau, has recently received thirty-nine specimens of rare minerals presented by J. Z. Davis, viz.:

Æschynite, Amarantite, Aphthitalite, Asparagus stone, Auerlite, Barrandite, Bastnasite; Breunnerite, Carpholite, Caswellite, Childrenite, Corynite, Dawsonite, Dysanalite, Edenite, Eosphorite, Evansite, Fanjasite, Gibbsite, Gieseckite, Glagerite, Guitermanite, Haydenite, Helvite, Henwoodite, Herschelite, Humboltilite, Indianaite, Kotschubeite, Lehrbachite, Malacon, Milarite, Plattnerite, Pyrosmalite, Sperrylite, Syngenite, Tarnowitzite, Tritomite, Roselite.

There has also been received a specimen of Wollastonite—quartz-schist, a new rock from Keeler, Inyo Co., Cal. Fossil crinoid stems of unusually large size, and a number of other California fossils. Arguerite, fine specimen, from British Columbia, W. B. Logan, Jr. Fine Colemanite from Mrs. J. W. S. Perry. Polished marbles, A. L. Seager. Rhyolite, Felsite, Aplite and other rocks of California, in some cases showing the gradual transition from one rock to another.

Between Night and Day.

The exact time at which darkness gives place to dawn—the dividing time between day and night—was legally determined, and a verdict of $25,000 given on the decision, in the Court of Common Pleas in Philadelphia recently. A young woman was knocked down by a locomotive on the Reading road while she was walking over a crossing at Norristown at 6:30 o'clock in the morning of February 14, 1893. The engine did not display a light, nor did it signal with whistle or bell. The company claimed that it was not negligent, because at that hour dawn was breaking and no light was needed, and the entire case rested on whether or not it was daylight when the accident occurred.

The sun rose on the day of the accident at 6:54 o'clock. Several astronomers and other experts testified that half an hour before sunrise it is as dark as at any time of night. From that time until sunrise light comes so slowly that the point of half-light is reached only seven minutes before sunrise. During the last seven minutes before sun-up light comes very rapidly, until the full day breaks. The plaintiff's lawyer claimed, therefore, that at the time of the accident, twenty-four minutes before sunrise, it was pitch dark. The jury rendered a verdict of $25,000 in her favor.

ONLY eighteen of the 13,000 steamers recorded in Lloyd's Registry are credited with a speed of twenty knots an hour and over, and only forty-five can show nineteen knots. Twenty-five of this number were built on the Clyde.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XV.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894.

1855.—Dr. J. B. Trask, first State Geologist, a faithful and devoted State official, was first to look on these minerals with scientific interest. In his report to the Legislature of 1855 (Senate document No. 14) he called attention to their importance, abundance and value. As that report is now extremely rare, I have quoted it in full, for I am sure it must prove of interest at this time to at least some of the readers of this paper.

"Bitumen is another of the more abundant mineral products of this portion of the State, and is found in very large quantities. This article is available and well adapted to the manufacture of gas, for the purposes of illumination, and will probably be used to a considerable extent in this country, the only practical objection to such a use of it being the fact that no valuable residuum is left in the retort after the extraction of the gaseous constituents. As this mineral yields a much greater volume (being nearly double) of illuminating gas than any other in use, it is very questionable whether it would not be equally profitable from this circumstance.

"In the use of coal we have the coke remaining, which may be applied as an article of fuel; but the value of the latter in the market would probably be counterbalanced by the increased volume of illumination matter in the simple bitumen. The expense of transporting coal from distant regions must very materially enhance the price of the commodities resulting from it; but in the use of the asphaltum upon our coast, this heavy item would as a natural consequence become materially diminished. The only real objection to the introduction of the latter article for the above purpose is that there may not be sufficient quantities of the mineral obtainable for so extensive uses as would be required. This is a valid objection, and should be well considered before entering on a speculation of that kind. From what is already known of these beds, they certainly have the appearance of being adequate to the supply of any ordinary demand for those purposes, as they are frequently to be met with covering many acres of ground. This fact, however, in regard to quantity can only be determined positively by clearing one or two of the larger springs, and thus ascertaining the actual amount of the mineral discharged per day or per week; and should it be found anything near adequate for the demand for gas manufacture, the collection and transportation at fair rates of prices will form a much greater source of revenue than the entire cattle trade of those counties at the present time. A little attention to this subject will convince us that a heavy and lucrative business may be conducted in these departments of trade if the necessary measures are adopted to bring this element into practical notice, for, as stated in the preceding pages, these springs extend from the county of Santa Clara to San Diego and most of them near the coast. To illustrate more fully the advantages to be derived, and the extent of the business that now lies untouched in this particular, it will only be necessary to allude to the quantity of coal required for the purposes of illumination at present in this State. The requirements for the city of San Francisco are about 5000 tons per annum. At an average price of $22 per ton, equal to $110,000. The demaud for Sacramento is about 2000 tons, which, at the same price, equals $44,000, the total amount being $154,000. Allowing the coal to produce (which the best quality will) 1100 pounds of coke from the ton of coals, the value of the coke as sold here at about 62 cents per bushel (high price) will yield a return upon the original cost of a little more than $12 per ton, or a sum total of nearly $87. This estimate is based on the product of the Scotch coal, the specific gravity of which is but 1.27. The asphaltum of this State has a specific gravity of about 1.62, the difference in the excess arising probably from the earthy matter comprised therein. There cannot be less than 4000 tons of asphaltum lying upon the surface of the ground in the counties of Los Angeles and Santa Barbara alone withiu a few miles of the coast at the present moment. Its value determined in San Francisco would not be less than $16 per ton, equal in value to $64,000; and this amount alone would offer sufficient inducement to embark in the enterprise independent of any other consideration. The amount lying ou the surface in other adjacent counties is probably equal to the amount specified, so that 8000 tons would be a safe estimate to place upon the quantity already available.

"The analysis of this mineral exhibits the following available constituents for the manufacture of gas: In 100 parts there is found a limpid oil equal to thirty per ceut, and the same amount of charcoal, with a large per cent of ammonia, the balance consisting of earthy matter and water. Here, then, we have sixty per cent of the gross weight applicable to immediate use, the charcoal holding the same relation to the bitumen that exists in the coke to the coal. That the supply of this article is abundaut there can be but little question, and fully equal to 5000 tons per annum (the requirements of the State will not fall short of these figures for years to come), equal in value at $16 per ton to $80,009; and should it possess no more than an equal amount of illuminating matter, it will be seen that it is far more economical than the present use of coal.

"The only, or rather the principal question asked by those interested in gas manufacture is this: Is there a sufficient quantity to meet the demand for 5000 tons per anuum; or, in other words, if there is a sufficient quantity, is there every evidence of quality also to make it a reliable resource?

"The proper opening of these springs would undoubtedly furnish an ample quantity of the mineral, and, if the business should be judiciously managed, it would prove lucrative and permanent.

"It is to be hoped that this brief allusion to this subject may elicit attention from those who are intimately acquainted with the localities iu which it is found, to its proposed value as well as to the quantity which may be supplied."

(To be Continued.)

A "HANGING" electric railway is proposed for Berlin. It is to consist of an iron network, with iron rails supported by columns at equal distances, each passenger car to be suspended from two small wagons running on these rails.

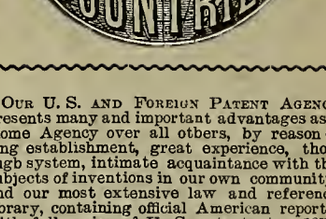
RUPTURE!

It has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a gradnate of Bellevue Hospital Medical College, of New York City.

DEWEY & CO'S Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Scientific Progress.

Horse Power of Boilers.

It is a very common thing to hear engineers connected with steam plants speaking of the horse-power of their boilers, yet if they were asked to define what they meant by horse-power of boilers, there is no doubt but many of them would suddenly discover that it was somewhat difficult to define clearly just what they did mean, and for a very good reason. Strictly speaking, there is no such thing as horse-power to a steam boiler, and in consequence the steam horse-power of a boiler is a very vague expression. But as boilers have been found so far a necessity in driving steam engines, the same measure applied to steam engines has come to be universally appled to the boiler, and like a good many other such accidental definitions, cannot very well be discarded. The unit of horse-power for boilers is not fixed except by arbitrary agreement among the parties concerned, the basis differing according to the nature of the work done by the steam. Many boiler-makers rate the horse-power of the boilers by the number of square feet of heating surface contained in the boiler. Although this rule is followed by many, it is no criterion as between different styles of boilers—a square foot under some circumstances being many times as efficient as in others; but when the average rate of evaporation has been fixed upon by experiments in one boiler, there is no more convenient way of rating others of the same style. But by an outsider no exact rating of a boiler can be made from a knowledge of only its heating surface. The following rules are observed in a good many boiler-houses, and may be useful:—For cylinder boilers nine square feet of heating surface are allowed, for flue boilers, twelve square feet, and for tubular boilers, fifteen square feet of heating surface per horse-power. Hence, if the total heating surface be known, divide it by nine, twelve, or fifteen, according to the type of boiler, and the quotient will be the horse-power of the boiler. If a boiler is tested and a statement of its horse-power desired, without regard to whether it is to supply its steam to drive an engine or for other purposes, then it is agreed upon by the majority of experts to consider thirty pounds of water per hour, evaporated at seventy pounds pressure from 100 degrees, as a horse-power. A standard was fixed by Watt at one cubit foot of water evaporated per hour from 212 degrees for each horse-power. This was at that time the requirement of the best engines in use. Most nations have a standard similar to and generally derived from Watt's horse-power, but owing to different standards of weights and measures, these are not indentical, though the greatest differences amounts to less than one and one-half per cent.

New Possibilities of Lighting.

In the rivalry between electricity and gas for lighting, the latter has recently gained an advantage through the invention of a special burner, made of rare metals that are rendered incandescent in the flame of the burning gas. As this invention is already on the market, there would be an impropriety in referring to it more extensively in these columns at present. But another possibility opened in the direction of cheaper gas-lighting is now announced.

One of the many combinations of hydrogen and carbon found in nature—petroleum and naphtha are among such substances—is acetylene. This is a colorless, inflammable gas with an unpleasant odor, yet possessed of high illuminating power. Hitherto it has not been feasible, though, to obtain it cheaply. Hence the discovery of a way to do this may prove important. Thomas L. Wilson, in treating certain refractory ores at his aluminum works, has "found that large quantities of calcium carbide can be produced commercially, from which acetylene is readily obtained." The *Electrical Engineer*, whose language is here quoted, declares that a burner consuming from one to one and a quarter feet of such gas per hour affords a light of about fifty-candle power, or about three times that of an ordinary six-foot burner with the gas now commonly sold, and three times that of the particular incandescent electric lamp that is most extensively used. The *Electrical Engineer* is "unable to discern any danger to electric-lighting interests in the new light," but concedes that it may be useful in houses not easily reached by its great rival. The discoverer, however, believes that an immense industrial development will proceed from the new mode of obtaining acetylene, the first step being the establishment of electrical furnaces to produce the calcium carbide.

Electricity as a Motive Power in Mining.

D. Selby-Bigge, in a paper on "Electricity as a Motive Power," thus summarizes the advantages of electrical power for mining operations: (1) That it can be transmitted long distances with small loss, thus making it possible to use power at such a distance from its source as would otherwise render it unavailable; (2) the conditions for conveying electrical power from one point to another require less space, are more easily put in and repaired, are easily tapped for branch circuits, and form a more flexible system throughout than any other mode of transmission permits; (3) the electrical system is ideal, viewed from the standpoint of cleanliness; the stations can be made to occupy a minimum space; the system does not vitiate the air in mine working; and the current used—500 volts—has been proved to be quite free from danger to life. Mr. Selby-Bigge gave an interesting instance of the way in which the benefits of electricity have been illustrated in this State, referring to the mine at Bodie where an electrical power plant has been erected to run a twenty-stamp mill, a full account of which appeared in the last issue of the PRESS.

Electricity in the Manufacture of Armor Plates.

Another modification of great value in the electric welding process has been made in the manufacture of armor plates for battle-ships. In the process of harveyizing plates it has been customary to leave a soft strip along the entire length of the plate, to facilitate the bolting. This left a weak spot, which, in actual warfare, a projectile might pierce at any moment. Now, the electrical current is applied to the plate in such a way that the temper is drawn only at the spot where the bolt is to enter, and the hardness of the rest of the plate is unimpaired.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

UNITARIAN LITERATURE sent free by the Channing Auxiliary of the First Unitarian Church, cor. Geary and Franklin Sts., San Francisco. Address as above. Mention this paper.

SITUATION WANTED BY ENGINEER AND machinist who understands the running and care of electric plants. Engagement preferred with parties interested in the use of electricity for the reduction of refractory ores. WM. H. RUE, 242½ 12th St., San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from G. H. Pease and J. B. Colwell in the North River mine, near Yankee Jims, Placer county, Cal., to impound tailings behind dam in Mexican Gulch; and from the Crown Point Mining Co., in their mine in the Tp. of Goodwin, Plumas county, Cal., to impound tailings behind log and brush dam in Porter Ravine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Dec. 17, 1894, at 1:30 P. M.

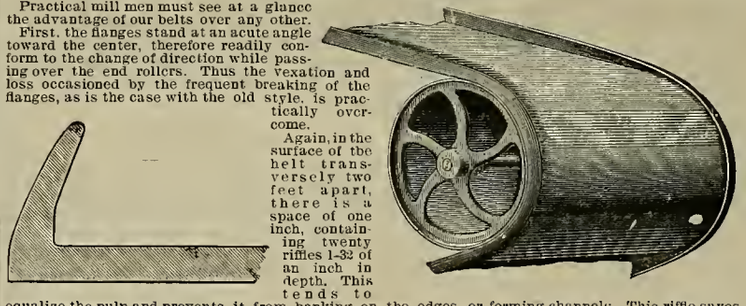
Office and Warerooms: 9 FREMONT St., San Francisco, Cal.
Or, Address the Company at its Denver Office.

Blasdel Improved Concentrating Belt.
We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.



Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

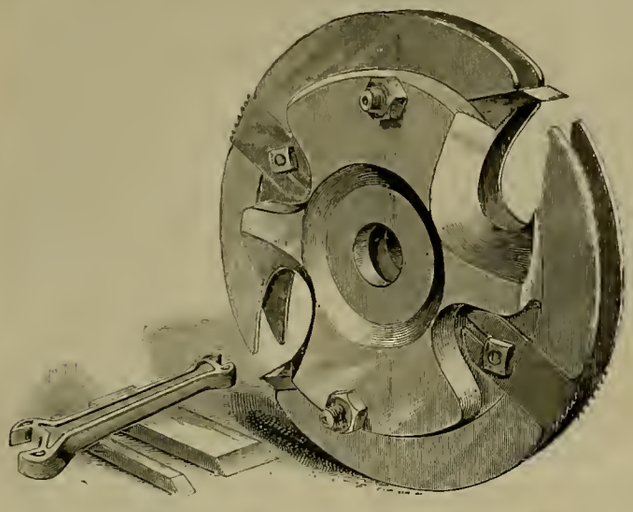
Mechanical Progress.

Wood Working Machinery.

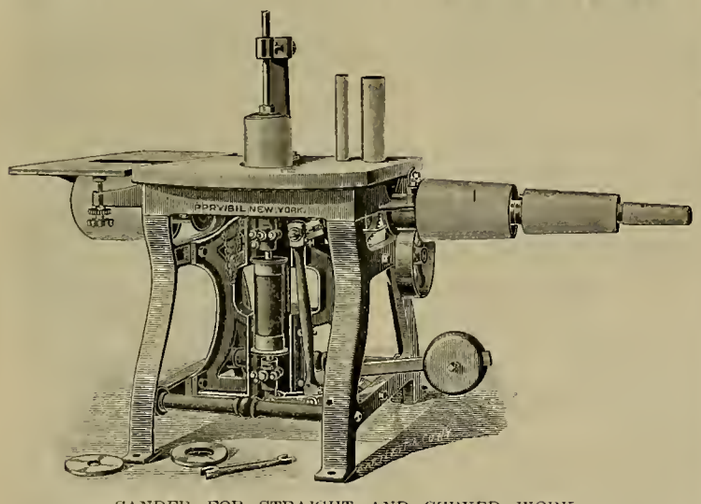
Herewith is illustrated an adjustable grooving head, designed for use with regular saw tables and with a parallel swing-saw machine. With the latter machine it can be very advantageously used with formed knives for moulding pilasters and other work, as well as for tenoning, rabbeting, etc. It is made by P. Pryibil, New York, and consists of two composition brass flanges provided with scoring knives,



PATENT ADJUSTABLE DADO OR GROOVING HEAD.

which can be adjusted to compensate for wear, and with interchangeable routing cutters of a width to correspond with the grooves to be cut. The room required on the arbor between nut and fixed flange (the loose flange being removed) is $1\frac{1}{4}$ for a $\frac{5}{16}$ inch groove, to $2\frac{5}{16}$ for a $1\frac{1}{4}$ inch groove.

The lower cut on this page illustrates a machine designed for sanding both straight and curved work, where it is desirable to preserve square corners, by a vertical drum projecting through a table. Three such drums are provided, $1\frac{1}{2}$, 3 and $5\frac{1}{2}$ inches diameter, each 12 inches long. They have a vertical motion, adjustable from 0 to 8 inches, which provides for using the full face of the drum on shallow work,



SANDER FOR STRAIGHT AND CURVED WORK.

and prevents the formation of ridges and grooves. Flat work is done by a horizontal drum, 12 inches diameter, 12 inches long, over which is a hinged table, provided with a screw for regulating its height. Three free horizontal drums, 8, 5 and 2 inches diameter, each 12 inches long, provide for free-hand work. The drums are covered as follows: Sand paper is cut to templets, and the edges joined by a piece of oil tough paper glued under them. The sand paper is then slightly moisteued and slipped upon the drums, where it dries tight and smooth.

Should the rubber, with which all the drums are covered, be accidentally injured, it can be turned down with a piece of sand paper on a block; or if destroyed, it can be replaced by a piece of carpet. This sander is made by P. Pryibil, New York.

Of the steam engines now working in the world four-fifths have been constructed during the last twenty-five years. France has 79,590 stationary and locomotive boilers, 1850 boat boilers and 7000 locomotives; Germany 59,000 land boilers, 1700 ship boilers and 10,000 locomotives; Austria 12,000 boilers and 2800 locomotives. The working steam engines of the United States represent 7,500,000-horse power, of England 7,000,000-horse power, Germany 4,500,000-horse power, France 3,000,000-horse power, Austria 1,500,000-horse power. This number does not include the locomotives, whose number in the world is 105,000, representing a total of 3,000,000-horse power. The world's steam engines, therefore, aggregate more than 26,000,000-horse power, equivalent, approximately, to the work of 1,000,000,000 men.

Oberlin Smith in the *American Machinist* in an article on "Why Does a Bicycle Stand Up?" answers the question by saying in effect that the center of gravity is maintained in equilibrium by shifting the front or guiding wheel from side to side as circumstances require. It is not a feat of balancing, nor is it due to the wheels trying to "maintain their plane of rotation." When the wheel is in motion the lateral displacement of equilibrium is easily and smoothly overcome by means of the handle bar.

"Timber Preserving Methods and Appliances" was the title of a paper by Mr. W. G. Curtis, read at the regular meeting of the Technical Society in the Academy of Sciences building on the evening of the 7th inst. The system of burnettizing was discussed in a practical way, its economy and utility being recommended. It has been in use on this coast for several months, and is found of great practical value in the preservation of railway ties, etc. A zinc-chloride solution applied to the wood is the principal part of the plan, which also includes a portable plant for lines of road on which the process is in use.

German Ironworkers' Wages.

In the grand duchy of Luxemburg the average earnings of the ordinary workmen amount to less than $200 per annum, and women earn about half this amount. The following is a list of wages paid iron and steel workers:

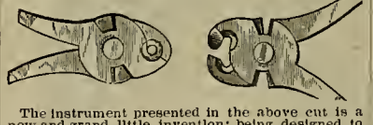
Steel Works—Foreman, $60 and $70 a month; assistant foreman, $1.15 a day; first converter hands, $1.07 a day; second converter hands, 81c a day; third converter hands, 73c a day; first founders, $1.18; second founders, 84c a day; third founders, 76c a day; first basin hands, $1.02 a day; second basin hands, 83c a day; third basin hands, 75c a day; fourth basin hands, 70c a day; first converter machinist, $1.03 a day; second converter machinist, 82c a day; three boys, 45c a day; laborers, 84 cents a day; weighers, $18 a month; smiths, 70c a day; masons, 90c to 95c a day; ingot cleaners, 52c a day; boys, 20c to 50c a day; machinist, 65c to 80c a day; lubricators, 60c a day; overseers, 75c to $1 a day; cupola hands, 60c a day; filters, 52c a day; all other employes, 60c to 80c a day.

Rolling Mills—Foreman, $50 a month; master rollers, $1.88 a day; first roller, $1.46 a day; second roller, $1.06 a day; assistant roller, 82c a day; machinists, 35c to $1 a day; lubricators, 40c a day; laborers, 45c to 53c a day; overseers, $24 a month; all other employes, 35c to $1.88.

Blast Furnaces—Overseers, $20 to $25 a month; chief founders, $1 to $1.40 a day; first founders, $1 a day; second founders, 76c a day; third founders, 69c a day; polisher, 69c a day; crane hands, 55c a day; machinists, 55c to 75c a day; masons, 65c a day; laborers, 60c a day; all other employes, 52c to 70c a day.

The necessaries of life cost as much in central Europe as they do in America. A workman's expenditures for clothing and rent may possibly be somewhat less there than in America, but in the town of Luxemberg coal costs $7 per ton, eggs 21 cents per dozen, rye flour 3, wheat flour 5, sugar 8, butter 25, beef 19, veal and mutton 16 to 20, fresh pork 20, and smoked pork 23 cents per pound.

GIANT POWDER FUSE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads, where Giant Powder is used in mining. The instrument is made of the finest cast steel, and crimps the cap on the end of the fuse *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. **Price 75c. each.**

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

JACKSON DISTRICT. — *Ledger:* The new gallows frame at the Argonaut is erected and the building to cover the engines is about completed. The foundation for the engines has been laid in concrete and is ready for the sole plates.

THE ANITA—P. Reichling of the Anita, has ordered timber for a thirty-foot gallows frame, one load of which has arrived upon the ground via Ione. The company has purchased two six-inch engines from Shingle Springs, and will soon have a hoisting plant upon Shoher Hill. The plant they intend to erect will be for the purpose of sinking from 500 to 1000 feet for prospecting purposes. When their mine is found and explored through the proposed shaft, if it is what they hope, a new large three-compartment shaft will he sunk and heavy and substantial hoisting machinery installed.

THE ALMA.—The manager of the Alma has concluded that hand drilling is not so profitable as can he secured with machines in the greenstone in which they are working and has ordered power drills for that mine. They are to he run hy compressed air and the compressor will he upon the ground during this week. He has also ordered two twelve hy sixteen engines for the hoist and upon their arrival will discard the smaller engine now in use.

MIDDLE BAR DISTRICT.—Work at the Vaughn & Kruger mine has been suspended during the rainy weather as they are using a "whip."

CLINTON DISTRICT.—Work is being resumed at the Clinton Consolidated after a cessation of nearly two years. The present determination of the owners of the property is to take the water out of the shaft, which is being done at the present time, and sink 200 more and prospect the ledge at the increased depth.

PLYMOUTH DISTRICT—Workmen have been husy with the hauling of a twenty-stamp mill on the Richmond from the Springfield in El Dorado county. All was on the ground, the timhers framed and workmen ready to commence the erection of the mill, when the recent rains made it necessary to suspend operations for a few days. The Richmond is one of the early day mines of this section and at one time had a 180-foot shaft. Some years ago O. Ball piped off a hank of earth and exposed a body of ledge matter fifty feet wide which can he traced the entire length of the claim. This ledge prospects $25 per ton and as soon as the mill is in running order it will be run upon this rock secured from an open cut.

At the Lucile they are taking out water all the time and have lowered it ahout 200 feet since they started up.

SUTTER CREEK DISTRICT.—*Record:* The consolidation of the Hector and Wildman mines under one management, with Superintendent Ross at the head of affairs, has marked a new era in the mining prospects of this section.

At the Hector mine the water is now helow the 200-foot level. For two weeks past the water has heen raised at the rate of 600,000 each twenty-four hours, or a steady stream running from the sump of thirty-three miners' inches. At this rate the 900-foot level, where the main tunnel will he started to tap the Wildman incline, will be reached within sixty days.

At the Wildman mine all the rock at present heing crushed by its mill of thirty stamps is heing extracted from the 1200 and 600-foot levels. On the 1200-foot level, as the drift is extended south, the ore-body is improving in quality, and in the width of the ore shoot, heing now fully equal to that heretofore taken from the 1300-foot level at the same distance from the shaft.

At the South Eureka over sixteen huudred feet of the drifts and crosscuts have heen run on the 900-level. During this prospecting a solid chimney of ore of more than 300 feet in length, ranging from three to eleven feet in width, has heeu encountered, much of it heing of a very high grade, running up into high value per ton. In addition to this an upraise was made of 120 feet, and the same grade of ore was found to the very top of the upraise. On the 500-level much prospecting was done. The ledge encountered was very large and extensive, but was of low grade, ranging from $2 to $7 per ton.

THE LEONI MINE—Located ou the Leoni ranch, west of Sutter Creek ahout two miles, was lately honded to Eugene Duffy, and a Mr. Johnson, of San Francisco. G. M. Thomas, of Sutter Creek, has taken the contract for sinking the present shaft fifty feet deeper, which will make it one hundred feet in all. The above property is a peculiar formation known as the "Talc helt," lying west of the mother lode and running parallel with it. The material is more like a greasy soapstone than anything else, and will readily crumhle to pieces at the slightest pressure.

Calaveras.

IN CALAVERAS COUNTY.—Mining husiness is recovering all along the mother lode. Calaveras county is getting its share of new capital. The Sau Audreas *Prospect* says the Gottschalk mine near that town has heen sold to Oakland parties. The first installation of the purchase money was paid over Wednesday, of this week, and the second payment will he due in a short time thereafter. The purchasing parties at once commence work upon the property, which has heen sufficiently developed to prove its worth.

Inyo.

MININO DEAL.—*Index.* The sale of a group of gold mines in Snow Canyon to Cleveland, Ohio, capitalists bas heen consummated, and it is expected that the promising property will soon he thoroughly developed and early prove dividend-paying. The Snow Canyon mining sale, it is hoped, portends a new era amongst the thousand and one varied classes of mining interests in the Panamint and Argus ranges, as we understand that the intention of the Eastern capitalists is to place a comprehensive reduction plant capahle of handling all classes of ores.

Nevada.

NEVADA IRON ORE.—*Journal:* P. K. Reid of Lovelock is again making shipments of iron ore to San Francisco parties. Ore from his mines is entirely free from deleterious substances, such as sulphur and phosphorous, and is sought after hy San Francisco men in the manufacture of fine steel. However, the high cost of transportation to the railroad, some sixteen miles hy team, precludes the use of the ore except very sparingly.

The White Cloud Copper Mining Company at Clemens, forty miles from Lovelock, and which have heen closed for several months, intend working their property again, commencing in the early part of January next. The National nickel mines, which have heen closed for some time, will soon resume operations on a large scale. It is the intention of the company to erect a plant for the reduction of the ore on the ground and the shipment of the product in matte to England where a ready market can he found for the same.

A KENNEDY MINE.—The Shamrock Company at Kennedy cut Mammoth ledge in the Union tunnel, which is located on the dividing line to the Gold Note and Morning Star mines. This ledge was cut in their upper tunnel when in 100 feet and was sixteen feet wide, and was a live quartz filled with sulphurets and averaged $18.50 per ton. The Union tunnel is in 350 feet. The vertical distance between the levels of the two tunnels is ninety feet, and the ledge has a pitch of thirty degrees, which would indicate 200 feet of "backs" to the upper tunnel.

Plumas.

THE SUNNYSIDE MINE.—The Sunnyside mine at Butte Valley is heing operated under the management of Col. Day. Twenty men are employed in running tunnels, extracting gravel and doing outside work. New tunnel to the extent of 450 feet has heen run since the new company began work in the summer. They succeeded in "hottoming" the mine, are now taking out pay gravel, and express themselves as well satisfied with the investment.

Siskiyou.

MINING NOTES.—*Journal:* The old Benz Bar mine on Klamath river, near Honolulu, now owned hy a Chinese company, is reported as paying exceedingly rich, and a few more Chinese nabohs will be taking their leave for China when the river mining season closes. No one knows what the Chinese take out, as they seem afraid to tell, but when doing well their return to China is a sure indication of realizing fortunes.

A great amount of mining machinery of latest invention has heen hauled to the Salmon river section lately for the hetter development of the placer, hydraulic and quartz mines. Several companies of moneyed men have purchased mines in that section, and will work them with energy during the coming winter and next spring, while there is an ahundance of water and plenty of snow to keep it up until late in the summer, or all year round, if the winter is not uuusually dry. Several wagon-loads of mining pipe of large size arrived at the Yreka R. R. depot last week for the Columhia mine at Scott river, which is now heing hauled to its destination; also some large giants and other apparatus.

Nine locations have heen made on a quartz ledge in the hills at crossing of Oherlin road leading iuto Shasta valley, near Greenhorn, within a mile of Yreka, the ground having heen taken up for several parties hy Judge Middlemiss of Salt Lake City, with intention of hringing in outside capital to open the claims. The opening of these mines may also develop the strata of blue gravel helieved to exist on the eastern horder of Yreka, and extending from Siskiyou Mountain, via Cottonwood creek, and the western side of Shasta valley, passing along the hase of Butcher Hill and the mountain on east side of Yreka creek.

OREGON.

PLACERS STILL YIELDING.—Baker City *Democrat:* On account of the open condition of tbe weather placer miners are still at work on a small scale, hut the final cleanup for the year is not far off. This has proven a most prosperous season for the miner, the value of the yellow metal taken out of the placers during the run now closing exceeding all expectation and breaking all previous records of production since tbe palmy days of the '60's.

EUREKA'S FAILURE.—Within the last three months the camp has revived to proportions worthy of extended mention. A few years ago Eureka was booming. At one time there were over 500 men employed and the indications were that it would he the greatest camp in Oregon. A large twenty-stamp mill, the finest in the State, was built. Sixty thousand dollars worth of ore was run through it, hut only $7.00 worth of hullion was saved; the rest went down the creek towards the Columbia. This was too much for the average man to stand and the property was closed down, and the camp was soon depopulated. It was all on account of not knowing how to treat the ore. Mining men of experience know how such things happen and may continue to happen in the future. However, it usually results in holding the camp hack a few years until improved methods of treating the ore have heen found and the camp then takes a new era of prosperity.

Last August John Longmaid, of Salt Lake, and J. Henry Longmaid, of Helena, took a four years lease and hond on the Eureka and Elkhorn Consolidated gold mine, and have been working the ore into concentrates which they are shipping to Tacoma smelters. Thirty-six men are now employed and they expect to increase the force as fast as the work will justify it. They are now milling thirty tons daily. Preparations are being made to increase the capacity hy putting in six more vanners and a roasting plant.

A 120-foot shaft will he sunk and hoisting works put in and drifting on the ledge from the bottom of the shaft will he pushed as fast as possible.

The mine is now worked through two 800-foot tunnels, and several hundred feet of stopes have been opened up. Mr. Longmaid states that it is his intention to work the ore hy the cyanide process, which he finds the hest adapted to the kind of ore they are now taking out. By this time next year he expects to furnish employment for 200 men.

The North Pole mine has closed down for the winter. Dr. Henry Leipman, representing the London syndicate who control the property, states that work will be resumed next year and that their mill will be fitted up with the cyanide process and active operations commenced. The results ohtained from a test made with his process have heen such as to warrant the statement that the property would pay a handsome dividend.

Eureka is about thirty-five miles west of Baker City and twelve miles from McEwen, the terminus of the Sumpter Valley railroad. It is destined to be a valuable feeder to Baker City, which is fast hecoming the recognized mining center for a large portion of Oregon.

SALE OF THE COPPER KING.—The La Grande *Chronicle* is told that a deal is on foot for the sale of the Copper King, the famous copper mine in that locality, and also Gilkison Bros.' mine, to a syndicate of capitalists of Salt Lake City and Philadelphia. Some time ago a carload of sample ore was shipped to Salt Lake and met with approval from the prospective purchasers. A son of Brigham Young, who is interested in the purchase, is now at North Powder, together with other capitalists. The sale of the Copper King and the large development that would surely follow would make a hoom in tbe North Powder mining country.

WASHINGTON.

TACOMA SMELTER.—Following is the secretary's report of the Tacoma smelter's operations for November:

Bullion shipped..... 3600 bars weighing 373,453 lbs.

Contents—	Value.
1,554.30 ozs. gold at $20 67 ...	$32,127 38
25,432.86 ozs. silver at 63c ...	16,022 70
371,607 lbs. lead at $3 per cwt ...	11,148 21
Total ...	$59,298 29

Number of men employed, 64.

Pay roll ...	$5,181 66
Wood choppers and teams ...	434 00
Total ...	$5,615 66

MINING DEAL CLOSED.—Loomiston *Journal:* J. H. Redman closed a deal for the Little Falls mining property on Cecil creek; consideration $7000. The property has heen hought hy Waupon, Wis., parties.

BRITISH COLUMBIA.

BETTER TIMES.—"Considerahle now capital has come into the Cariboo country this year," says A. McLeod. "For example, a Montreal company has just paid $75,000 cash for the Victoria Company's claims on Canal river and gives them an interest in the property hesides. They propose to do considerable work next year.

"The Horsefly claim had a small cleanup this fall, taking out about $9000 in gold, and has its plant ready to hegin hydraulic mining in the spring. Hohson is manager for this company and also for another owning claims on Canal river. He has had 300 men at work all summer cutting ditches, and will he ready to take out a large amount of gold next season.

"Other claims are heginning to interest capital—there are even plans for reworking old fields that paid so richly in the early days. In short, capital is getting into that country, and it may not be long till the Cariboo district takes its old place among the hig gold camps."

MINING IN THE BIG BEND.—The Big Bend gold country in British Columbia is situated on the Columhia river, about seventy miles north of Revelstoke. The season just passed has been none too prosperous for the gold hunters in that country. Heavy and oft-recurring floods have had a bad effect, keeping hack active operations and retarding the packing in of supplies. The claims heing worked center principally upon the Goldstream and its tributaries, and of these notably French and McCullough creeks, while a small number of Chinamen have washed the bars of the Columhia.

The greatest loss to any property was that to the Consolation, which suffered great damage during the heavy floods last June. The wreck has all heen cleared away, new buildings put up and the owners are now making good headway with their drifting. The Nestelle Company has a hig claim on French creek, and has already expended several thousands of dollars in opening up its property in a proper manner.

Forty-nine men will spend the winter in the Big Bend, sufficient supp ies having heen packed in to last them until spring. A correspondent estimates the gold output of that section for this year as follows: Frencb creek $17,000, Goldstream $3500, Sol Haiden claim $2000, McCulloch creek $500, Carne's creek $300, hars of Columhia river $300, Smith creek $200; total, $23,800. The Chinese who have heen working all summer on the bars of the river are loth to make a report of their labors, and it is just possihle that they have cleaned up more than they are credited with in the report. The most taken out of any one claim was from the Consolation on French creek. The amount was $10,000. The Big Bend is a camp of deep diggings, and it costs money to make the yellow metal loosen its hold on the hedrock. It is expected that next year the claims will he worked more extensively than at any time since 1865.

IDAHO.

REVIVAL OF A GOLD CAMP. — Salt Lake *Tribune:* The reports from the Yellow Jacket mining camp, seventy-five miles north of Challis, Idaho, indicated that a new hoom has landed there. As long since as the early sixties the gold quartz of this camp was worked hy primitive reduction methods, hut the heavy fissures were never thoroughly prospected, and the camp was finally ahandoned.

Now the camp contains over 300 men, the Yellow Jacket Gold Mining Company and the Columbia Hill Company are each putting in heavy licks on their gold quartz properties, while Pinney & Fox are constructing a flume one and a half miles to carry water for hydraulic mining in the rich placers of the gulch. Winter has commenced to close down the reduction husiness, hut it is confidently believed that spring will see 1000 men in the camp.

The Yellow Jacket Company have just completed the construction of a large frame structure for a forty-stamp mill, at an altitude of 6000 feet, and 2000 feet lower than the mine. Over 300,000 feet of lumher was used in the construction of the mill, every foot of which, and the lumber in the placer flume, together with that in the new mill of tbe Columbia Hill Company, was sawed on the ground hy sawmills operated by water power. The gold quartz is a free milling proposition and averages $12 to the ton. The placers of the gulches have never heen developed until the last two years, but Pinney & Fox elaim now that their limit is the limit of the gravel in sight, and until that is exhausted Yellow Jacket will be a good placer camp.

LOW-GRADE GOLD ORE.—A Centerville correspondent of the Idaho City *World* says: "I don't want to excite anyhody nor seem extravagant, but I want the world to know that Centerville has more low-grade gold ore witbin a radius of five miles than any known camp on the coast to-day. We have two or more reefs of ore that will average from $2 to $8 per ton, which, allowing a depth of 100 feet, will yield 20,000,000 tons. I think, from personal observation, that I am making a reasonable statement, and if anybody doubts it let him come and see. These reefs are yet unexplored, the deepest hole being twenty-six feet. This hole, however, if it proves anything, proves that the ore gets better with depth."

UNTOWARD CIRCUMSTANCES.—There has been a general exodus from Wardner during the past few days, says a dispatch; about twenty men have gone to California and nearly 200 bave scattered to different parts of the Northwest, many of them taking their families with them. Nearly twenty trunks were carried to the depot, and others are preparing to leave. There is no doubt that the closing of the Bunker Hill and Sullivan mine hy Manager Bradley meant a winter without work for Wardner's families. The buckets have been taken off the tramway and things are heing fixed up and laid away for a long season of idleness. Both sides are adhering to their plans and the merchants and property owners are greatly discouraged over the outlook.

MONTANA.

MINING NOTES.—Anaconda *Recorder:* Copper has been discovered in Prickly Pear canyon near Great Falls. The *Madisonian* reports that Engineer James McFarlane of Butte has purchased the Aurora Borealis mines near Silver Star for J. B. Haggin and tbat a payment of $10,000 was made.

Since the reports have gone forth of the resumption of work at the Combination and Bi-Metallic mines, there has been a heavy influx of miners to Phillipsburg. In one day 150 tickets were sold in Butte and 30 in Anaconda.

J. K. Clark of the Moulton mine in Butte is authority for the statement that not enough custom ore is being mined in Butte to keep one quartz mill husy.

The ore bins of the Anaconda mines in Butte hold ore enough to fill a train of forty cars.

Review: The Morning Star mine is located in the city of Butte and has produced over $250,000. Although the property is only 200 feet wide there are four well defined veins upon it, and a shaft has been sunk to a depth of 300 feet. The ore chute on tbe 300-foot level will average two and one-half feet of ore that will mill 28 ounces of silver and $8 in gold and from 3 to 4 per cent in copper. The ore chute is at least 175 feet in length, and it is said that a company is under formation to work this property on an extensive scale.

SOUTH DAKOTA.

GOLD MINING IN BLACK HILLS.—The Black Hills *Times* says that the Omaha-Grant Smelting and Refining Company has joined the Homestake and the Deadwood and Delaware Companies in the establishment of a smelter in that district for the purpose of treating concentrates, of which the Homestake Company has a large supply on hand. "The enterprise," says the *Times*, "will he sustained by capital enough to make everything first-class and complete. The hackers are men of great means and valuable experience, who will make an unqualified success of it. It is hardly likely that anything will be done this winter, hut steps will he inaugurated very early in the spring and the project pushed forward very rapidly."

The amount of gold ore at present mined and milled is the largest in the history of the camp.

The Black Hills district received a severe set-back when the surface ore was exhausted. It now has four methods of treatment in successful operation, which accounts for the steady dividends from the leading mines. These metbods are milling, smelting, chlorination and cyanide. The mills are handling 3,000 tons of ore per day. At the Golden Reward chlorination works, from 120 to 130

tons per day are treated, while the new cyanide plant of the company is calculated for 200 tons per day. The pyritic smelter owned by the Deadwood and Delaware Company has a capacity for 100 tons per day, and the cyanide plant of the Black Hills Gold and Silver Extraction Company is being increased from fifty to seventy-five tons per day, equal in size to the cyanide plant at Cripple Creek.

With a capacity for ore treatment equal to 3,500 tons daily, only a portion of the mines in the district are as yet producers. Cheaper and more successful treatment will gradually induce others to develop, until the Black Hills district will take a front rank among the successful producers of gold. This may all be credited to the metallurgical advance of the last two years.

NEVADA.

ESMERALDA COUNTY.—In Silver Star district six hundred tons of ore that will mill $30 to the ton are on the dumps of the different claims. The five-stamp mill has turned out $15,000 in the two months it has been running on half time. Twenty-five men are working for wages in the district, and about thirty more are leasers.

ARIZONA.

Gazette:—At the Kincaid mine, near the Hassayampa, Kincaid's claim at a depth of fifty feet has opened out to a four-foot streak of $15 free-milling gold ore. Kincaid, J. C. Rankin, and two Chicago parties some time ago, when the pay streak only averaged twenty inches, refused $10,000 for their half interest. It is believed that the new strikes raise the mine to a $40,000 proposition. The property is only two miles from the Hassayampa and the new railroad.

LOOSE MINING LAWS.—*Journal Miner*: Colorado miners, who have been driven to this section, complain of the loose mining laws in force in this territory, which permit a man to locate and hold a claim and relocate and still hold it without doing any work on it. It is said that in some districts as many as a score or more of claims are held by a single individual who has never done any work on them, and that nearly every district is cursed with monuments, plastered over with location notices, but no work done on the claims. This is simply a dog-in-the-manger way of doing business. The locator is not benefited, as it is impossible for him to sell an undeveloped claim, and the country is held back in its development, as genuine prospectors who would be willing to develop these claims would take hold of them if they were not already held by others. In Colorado a prospector is compelled to sink a given number of feet after locating his claim, before he can record it, and Colorado miners say that this law gives good satisfaction.

COLORADO.

DEEP MINING MACHINERY.—Boulder *News*: Quite a number of mines in the country, during the present season, have been putting in machinery for deep mining. One great trouble heretofore has been that the mines have only been scratched over. With such machinery as the Revenue, Utica, Pine Shade and others now have, it will be possible to carry on the work in a manner that will not excite the ridicule of those accustomed to great mining operations carried on in a scientific manner.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 4, 1894.

530,381.—BREAKDOWN GUN—M. S. Barker, Eugene, Ogn.
530,344.—DENTAL ENGINE—J. A. & B. A. Jeffery, S. F.
530,347.—VOTING MACHINE—J. Mourot, Modesto, Cal.
530,241.—DUMPING WAGON—J. C. Proctor, Dallas, Ogn.
530,251.—BUGGY SHAFT—H. G. Vaughan, S. F.
530,252.—NAIL SET—C. G. White, Woodland, Cal.
530,375.—ROTATING MOTOR—W. H. Willey, Santa Monica, Cal.
530,149.—COFFEE PERCOLATOR—H. Wilson, Indian Diggings, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

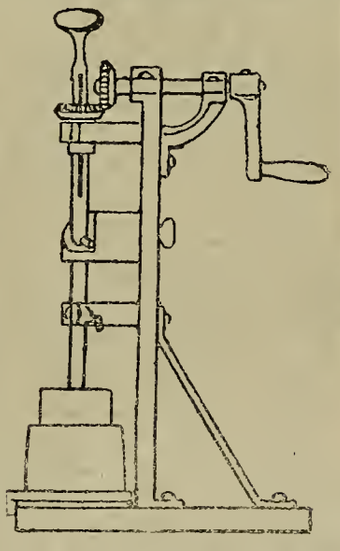
ELECTRIC DENTAL ENGINE.—Joseph A. Jeffery and Benjamin A. Jeffery, San Francisco. No. 530,344. Dated Dec. 4, 1894. This invention relates to a dental electric engine. The object of the invention is to provide an improved means for supporting and adjusting the motor so that it may be turned to any desired position for application of its power, means for reducing the noise and vibration caused by its rapid rotation, to provide an improved means for reversing the motor and for connecting and disconnecting the drive shaft. The motor is swiveled upon a bracket which is secured to the wall or other suitable point projecting and turnable about its points of attachment, so that the motor can be swung around in an arc of a circle, the size of which depends on the length of the bracket. A switch mechanism is fixed near the bracket and suitable connections made through or along the bracket to the motor, this switch being actuated by a foot lever within convenient reach of the operator, so that the motor may be reversed at any time with little difficulty. A two-part shaft is employed, the motor armature rotating within its case upon one portion, while the other portion extends outwardly in line with it, and an electro-magnet is fixed to and turnable with the motor armature, while a disk armature revoluble with and movable longitudinally on the shaft of the motor serves to connect the two when the electro-magnet is energized so as to attract the clutch armature to itself, and is disengaged whenever the current is cut off and the electro-magnet de-energized.

VOTING MACHINE.—Julien Mourot, Modesto, Cal. No. 530,347. Dated Dec. 4, 1894. This invention relates to a machine by which votes may be cast for any number of persons, and the number of votes cast for each and all the candidates are automatically registered and indicated. The objects of the invention are, first, to construct a machine which will automatically register the number of votes cast in favor of any or all candidates seeking election, at the same time indicating the number of electors who have cast their ballots; second, to so construct the machine that only the party voting will know for which candidates he has cast his ballot; third, to render it impossible to tamper with the poll; and fourth, to prevent an elector voting more than once for the same candidate or for more candidates than he is entitled to. The machine is constructed to operate upon what is known as the "Australian Ballot System," and is provided with a series of depression levers or pitmen, tapes or numbered carriers, and drums upon which the tapes are coiled, mechanism by which the numbered carriers are advanced a single figure by the depression of each of the levers so as to indicate an additional vote, and a locking mechanism to lock all of the levers and render them inactive after a single operation by each voter.

To Crush Samples of Ore.

There is always a demand among assayers, miners and prospectors for a simple, strong and easily portable machine that would grind samples of ore to a very fine powder in a few minutes, in order to obtain an immediate analysis of specimens. The old "iron mortar and pestle" and "iron plate and flat hammer" methods are laborious and require special skill in order to yield the right results.

A machine has been invented, which is herewith illustrated, in which, by means of a crank and bevel gear, rotary motion is imparted to an upright shaft, terminating above in a knob and below in a stout pestle, which is inserted in a mortar. This rod has a vertical play in the hub of the horizontal gear-wheel, but a projecting feather along its side, extending into a slot in the wheel, compels it to revolve when the wheel does. The spiral



track, on a bracket through which this shaft extends, lifts the latter a short distance with every revolution, and then drops it abruptly. Thus the coarser work of crushing is done as in a stamp-mill. But when it is desirable to reduce the product to a fine powder, this bracket is lowered by releasing a thumbscrew, and then the pestle merely goes round and round, resting down in the mortar. The latter may be removed easily from is position, if the operator first lifts the vertical shaft by its knob. A machine of this type, about eighteen inches high, is capable of delivering a sixteen-pound blow. By a slight adjustment, the force of this stroke may be doubled. Of course the design may be reproduced in any size.

The Ideal Steam Oil Refiner

FOR STEAM POWER PLANTS.

The Purity Oil Filter

FOR WATER POWER PLANTS.

Will reclaim your waste oil and make it equal and often better than new oil. Will reduce your oil bills 50 per cent and save your bearings. In use with the largest and best plants everywhere. For prices and particulars, address

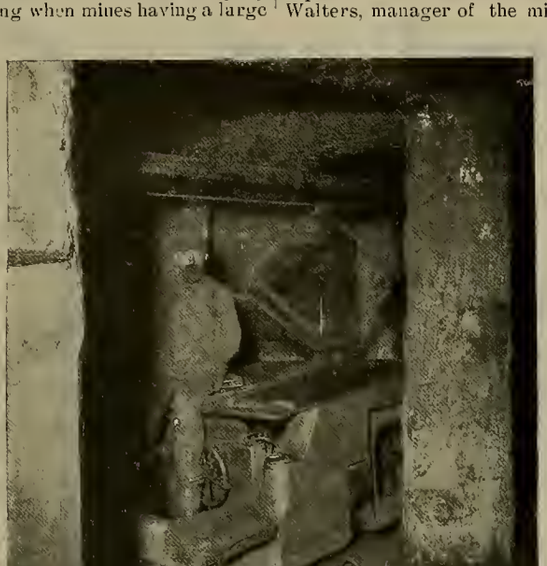
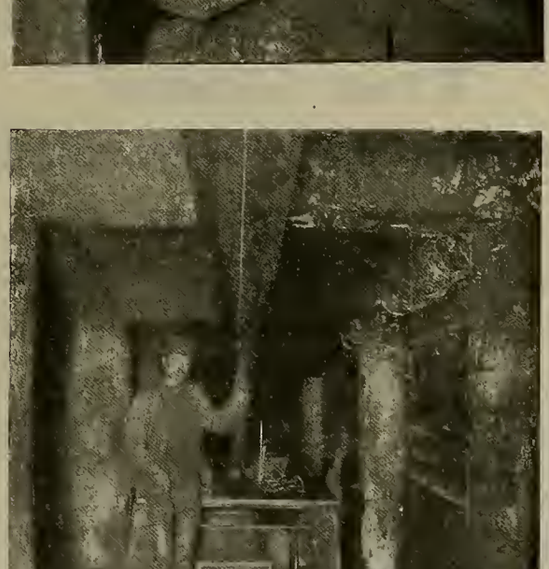
Electrical Progress.

Electric Haulage in a Michigan Mine.

The use of the electric locomotive in mine haulage work becomes daily more widespread as the advautagc inscparable from the adoption of electricity in mines becomes better recognized. In coal and iron mines they are steadily supplanting the rope systems and mule haulage, and the time seems rapidly approaching when mines having a large





output will gencrally adopt electric power for this purpose.

About two years ago the Pittsburg & Lake Angeline Iron Mining Co. determiued to install an elcctric plant, after having become convinced of the economy of the step. At the surface a power-house was constructed, and a 14x30 Reynolds-Corliss engine erected to drive a D-62 500-volt general electric bi-polar geuerator. Armored mains are taken down the mine on porcelain insulators, and connected in the usual manner to the trolley wire and track.

The haulage plant proper consists of two general electric T. M. M.-14, 30-inch gauge locomotives, each being equipped with two motors. The locomotives are capable of exerting a draw bar pull of 1500 pounds each, at a speed of from six to eight miles an hour. The motors are of the iron-clad waterproof type.

The length of haul is somewhat short for locomotives, but is too long for profitable tramming by meu, the distance averaging from 250 to 1400 feet.

The grade is 8 inches in 100 feet, in favor of the loaded cars, and the curves are sharp, varying from twelve fcet radius up on account of the narrow veins. No scrious delay has occurred since the plant began operation.

The cost of hauling at the present rate of workiug, which is not up to the capacity of the locomotives, is two cents per ton, including oil, waste and repairs. In a letter from Captain Walters, manager of the minc, referring to this cost, he says:

"This is per tou on the ore hoisted. Extra to this, we close timber all our ground. The timber is hauled arouud aud left with each party of contractors in turu. I should say here that I have put in no percentage for the first cost or outlay. If I had to do this work by hand, as we used to do, I would have been delighted to set a contract in the mine to have the ore trammed and timber delivered at places needed at eight cents per ton for ores hoisted."

Writing to the *Electrical Engineer* of New York, Professor Elihu Thomson states that in 1882 the succeeded in converting ordinary carbon rods completely into graphite by passing very heavy electric currents through them. His patent application was, however, unfavorably received by the patent office, and he abandoued the matter, though hc still believes that, with cheaper power, graphite of fine quality cau be made artificially on a considerable scale.

Electric Conduit Railway.

At a recent meeting in New York for the purpose of discussing the feasibility of the electric conduit railway, the question beiug of present importance to San Francisco, Joseph Sachs put the whole thing in a nutshell in the statemeut that the crux of the electric conduit situation was not "Can it be built?" but "What will it cost?" The lowest cost, as very carefully estimated, can be put at $30,000 or $40,000 a mile, single track. Even this estimate is not for the best construction, and does not take into account difficulties arising from pipes, sewers, etc. There could be no comparison between the conduit and the trolley. The trolley has been of enormous value in the ten years of its life, and it will remaiu supreme in its owu field. There is little prospect of a couduit system ever being put in as cheaply as the trolley, and this fact will rctard the adoption of the conduit in many of the largest cities. In cities where the trolley is forbidden, an underground, or conduit system, will be the next natural evolution, and that developments in that direction are not far off is shown by the fact that three important corporations are now testing the ordinary open-slot conduit, and, so far, with reassuring results. The point to aim at in a conduit system, and the attainmeut of it will do more to bring the system into favor than anything else, it is to secure absolute simplicity by getting thc mechanism down to the simplest forms and fewest parts, so that it can always be gotten at readily and easily repaired. An interesting point in the discussion was brought out by C. B. Fairchild, a well-known authority on street railroads. He said it was a qucstion with many peoplc whether there is any imperativc dcmand for an uudergrouud system. The matter has been studied quite thoroughly, and some of the large electric companies have made designs for an underground system. One of these companies which proposed to put in such a system in New York, underwent an entire change of heart. After studyiug it they concluded that a successful underground system would be a calamity for the street railway interests, rcasoning that if oue were adopted, every little city throughout the country would demand that all the wires be put underground, and that would mean ruin to nine-tenths of the street railways of the country. Mr. Fairchild mentioued this, not as an opinion, but as iudicating what the feeling in regard to the conduit was in street railway circles. He also stated that the great difficulty in the underground system in this country has been with the moisturc and gas that collects in the conduit. When he was studying the system two years ago, thcre were certain times when it was impossible to tell what became of the current. Perhaps the car would run all day without any difficulty, everything being all right. As soon as it began to run next day the current would be gonc, and they would hunt for an hour or two and not fiud it. Presently it would comc back, and the cars would run as if nothing had happened. How that current went away he never knew, and he never heard any explanation of it. It seemed to go through the gas or moisture that accumulated in the conduit, which has special and most peculiar characteristics. It is a good conductor, but beyond that, engiueers seemed to know nothing about it. The general belief in electrical circles now is that for heavy traffic, under certain conditions, the conduit is the coming system for street railway work in large cities. It may raise difficulties with some of the companies that have a clause in their frauchise compelling them to put in an electric conduit when one proved to be a success has appcared. Under such conditions it might be as inconvenient to the company as it would be desirable for the public, but this would not hinder its adoption.

Practical Information.

Cost of Bread.

In view of the demand for cheaper bread, begun at a number of cities, the Agricultural Department has given out a bulletin on the "cost of bread," taken from the forthcoming report of Prof. W. O. Atwater on the nutritive value of foods. It says:

"In practice 100 pounds of flour will make from 133 to 137 pounds of bread, an average being about 136 pounds. Flour, such as is used by bakers, is now purchased in the Eastern States at not over $4 per barrel. This would make the cost of flour in a pound of bread about 1½ cents. Allowing one-half cent for the shortening and salt, which is certainly very liberal, the materials for a pound of bread would cost not more than two cents. Of course, there should be added to this the cost of labor, rent, interest on investment, expense of selling, etc., to make the actual cost to the baker.

"Very few accurate weighings and analysis of bakers' bread have been made in this country, so far as I am aware; but the above statements represent the facts as nearly as I have been able to obtain them. The average weight of a number of specimens of ten-cent loaves purchased in Middletown, Ct., was but one and one-fourth pound. This makes the price to the consumer eight cents per pound. The price of bread and the size of the loaf are practically the same now as when flour was twice as much.

"The cost of bakers' bread is a comparatively small matter to the person who buys only a loaf now and then, but in the Eastern States and in the larger towns throughout the country, many people, and especially those with moderate incomes and the poor, buy their bread of the baker. Six cents a pound, or even half of that amount for the manufacturer and distribution, seems a very large amount.

"In the large cities competition has made bread much cheaper, but even there the difference between the cost of bread to the well-to-do family, who bake it themselves, and to the family of the poor man, who buy it of the baker, is unfortunately large.

"The report also goes into the chemistry and scientific features of bread making. The nutrients in bakers' bread are: Protein, 9 per cent; fats, 2; carbohydrates, 56; mineral matter, 1; total, 68 per cent nutrients and 32 per cent water. In wheat flour the total nutrients are 88 per cent and water 12 per cent, showing that the nutrients are largely reduced by baking. The potential energy in a pound of flour is 2000 per cent and in a pound of bakers' bread 1300 per cent. With the increase in the proportion of water in the bread as compared with the flour, the proportionate nutrient is diminished, but the addition of shortening and salts brings up the fat and minerals in the bread, so that the proportions are larger than in the flour."

Leather Belts.

No one using leather belts can afford to be indifferent to their care. There is a certain amount of elasticity in all good leather belting, but time and continued hard work seem to destroy or at least weaken its power. Then comes the question whether it is better to simply tighten the belt or use some form of dressing. Experience of many very practical observers seems to favor the use of good dressing, as tightening the belt strains it and calls for more engine power. A dynamo engineer who is transmitting 60 to 65-horse power, with a 50-foot link belt eight inches wide, running from a 72-inch pulley on driving shaft to a 13-inch pulley on dynamo, claims that freedom from jumping and flickering of the lights is due entirely to the belt dressing used, and that tightening never helped. The superintendent of a large printing establishment has an 18-inch main belt now running its eighth year which has never been taken up, and it would be extremely hard to convince him that the dressing used does not preserve the life of the leather and keep it soft and elastic. Of course one should be careful what sort of dressing is used. Soap, rosin, tar and tallow should not be used at all. Even castor oil is criticised.

Findlay Natural Gas Going Out.

At Findlay, Ohio, the Creighton gas well which a year ago had a rock pressure of 180 pounds is now down to nineteen pounds. In the Marion township field, east of Findlay, where a few years ago the great Thornton well furnished enough gas to supply Tiffin, twenty-eight miles away, the pressure has gradually fallen until the two best wells—the Ross and the Sparks—show a pressure of only nine pounds, and the gas is unable to propel itself along the mains which lead to the city. An even more deplorable condition exists in the great Stuartsville field, four miles north of the city. Here was the center of the great Ohio gas field. For years this territory was used to supply Findlay, Toledo, Detroit, Saudusky, Fremont and other cities. Now the pumping stations of great corporations are at work sucking air and trying to keep up a semblance of furnishing gas. During the mild weather there is an abundance of gas for domestic consumption, and during the past summer the factories have been supplied; but when the first frosty morning came, down went the blaze in every store. People are reluctantly going back to the use of coal and wood, and the fuel dealers and stove men are driven to keep up with the demands made upon them.

William J. Chalmers Esqr.
Pres. Fraser & Chalmers.
Chicago. Ill.

Dear Sir:-

Your letter of July 7th. is duly received.

In regard to your enquiry regarding our Riedler Compressor, supplied by your Coy, over eight months ago, I must say, that the Compressor is giving excellent results, and every satisfaction, while running either by steam, or water power.

During the last twelve years, I have seen operated, and have operated, many different makes of air Compressors, including the Eclipse, Reliance, Burleigh, National, Rix, & Firth, Ingersoll Sargent, etc. etc. and in no instance, have any of the above given the results of the Riedler. Therefore, I have no hesitation in saying that the Riedler, is the best, and most economical Compressor on the market today. We have made comparitive tests here, of the Ingersol Sargent, and Riedler, which show, greatly in favour of the Riedler.

Yours very truly.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 13, 1894.

Silver still suffers an eclipse, and all the work, expense and risk involved in silver mining, if continued, can hope for no present profit. Anything under 65 cents an ounce means loss, except in most rare cases where the ore is of extraordinary richness or other favorable circumstances. So far this year China has taken $7,000,000 more silver from London than in '93, and the assumption is that should Japan insist on the demand of a war indemnity of 400,000,000 yen, silver would be the metal of payment, which would cause an immediate raise; but the amount is problematical. It would seem that administrative juggling with the issue of bonds has more to do with the present slump in silver than anything else.

The coining of standard silver dollars has been discontinued. During the spasmodic ante-election effort in that direction about $3,000,000 were coined.

The syndicate that bought the recent issue of $50,000,000 Government bonds clears $1,200,000 on the transaction. The clever purchase was made at a little over 1.17. They are now held at 1.19¼. It is thought better financial methods on the part of the U. S. Secretary of the Treasury could have secured that top figure as readily as private parties, as it is the pledge and faith of the Government which makes them worth that.

During November 2190 flasks of quicksilver were sent from here by sea. For eleven months of '94 the shipments aggregate 14,845 flasks, worth $458,162. For the same part of '93 the shipments were 13,400 flasks, worth $534,814.

—The General Electrical Company, which has the contract for carrying the electric current from Folsom dam to Sacramento City for use for power, light and heat, has sublet the contract for poles, and work on the line is to be commenced at once. The line will be twenty miles, the longest transmission line in the world. A double row of poles will be used, each carrying sixteen copper wires. The dam and canal are already completed and work is being pushed an the power house.

—The new line of the Postal Telegraph Cable Co. follows the routes of the Santa Fe and A. & P. Railroads.

Mining Share Market.

SAN FRANCISCO, Dec. 13, 1894.

The week has been a light one in every way, aud '94 will apparently go out in gloom. Meanwhile the mines themselves show an improved condition. The absence of anything like big money is the chief complaint on the street, cents having taken the place of dollars.

The Comstock Tunnel Co. has effected a compromise and settlement of all its legal difficulties and expects to make a good financial showing in '95.

During the month California mines ask for $22,500 in assessments, and Nevada mines $153,620, of which amount the Comstock represents $133,620.

The Con. Cal. & Va. miue pays a 25-cent dividend next Monday. During November the report shows 1647 tons of ore were worked, yielding $51,843 gold and $49,365 silver. This is an average of $61.44; the battery assays showed $76.59—a loss of over $15 per ton. That would make a pretty good dividend itself.

The following illustrates the changes of the week:

Coast Industrial Notes.

—The Tacoma Mill Company is furnishing 250 employes with ten hours' work daily.

—A car works is to be built at Seattle, Wash., with a capital stock of $1,000,000.

—The Piedmont branch of the Oakland street railway system is to have an electrical equipment.

—L. C. Pressley of this city has been granted a patent, No. 529,846, for a conduit electric railway.

—Mr. Bishop, of the Pacific Power Co., has bought a 115-kilowatt multipolar 500-volt generator for his power plant.

—The Electric Light Co. at Sisson has changed hands, and is now run by the Wickham Bros., who have reduced the rates.

—An electric railway along the ocean beach for a distance of two miles southward from the Cliff House, is the latest project of the Market St. Railway Co.

—One lot of 31,364 bushels of blue stem wheat has just been sold at Lewiston, Idaho, for 31.80 cents per bushel. It will be shipped to an exporting firm at Portland.

—The travertine quarry near Bridgeport has been sold by its discoverer, W. E. Lindsay, to a San Francisco company. The property will be developed next spring.

—Four more British Columbia salmon canneries have been sold to an English syndicate—the Lighthouse cannery on the Fraser, two on the Naas river and one on the Skeena: $30,000 was paid for the former.

—The Washington Cedar Company has incorporated at Seattle, capital stock $300,000, to lease all the shingle mills in the State of Washingtou, numbering 234, with the intention of controlling the red cedar shingle trade.

—A new fuel to supplant dear coal is proposed in the mixture of Santa Barbara asphaltum and peat from the vicinity of Lake Tulare, both materials existing in apparently inexhaustible quantities. The projectors figure that they can supply fuel satisfactory for every purpose for $3 a ton. R. H. Coe, of Boston, is investigating the subject.

—The Oakland Iron Works, recently partly destroyed by fire, will be rebuilt. A shop 100x100, all under one roof, will be divided into three parts by the columns sustaiuing the roof. There will be a traveling crane in each, capable of holding any piece of machinery or material not over twenty-two feet high and not weighing more than fifteen tous.

—The South Yuba Water Company asks Sacramento for a franchise to bring in electric energy for power, light aud heat into that city from the power site at Newcastle, thirty miles distant. This company is now installing plants for lighting Auburn, Rocklin, Newcastle and Penryn with electricity and claims to be able to furnish 4500 horse power for Sacramento.

—What is believed to be the largest plow in the world is owned by Richard Gird, of Chino, Cal. This immense sod turner stands eighteen feet high and weighs 36,000 pounds. It runs by steam, is provided with twelve 12-inch plowshares aud is capable of plowing fifty acres of land per day. It consumes from one to one and a half tons of coal per day, and usually travels at the rate of four miles an hour.

—The United States battle ship Monterey left the harbor of Fairhaven recently, when she lay at anchor 600 yards from a coal dock, and sailed up Puget Sound fifty or sixty miles to fill her bunkers with Canadian coal from the Comox mine, near Vancouver, because she could get it $1 a ton cheaper than on this side of the border. Why? Because the Dominion coal is mined by Chinamen who are paid $1 a day. The Fairhaven coal is mined by white men who demand $3.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other ageney can afford Pacific States inventors half the advantages possessed hy this old, well-tried and experienced firm.

DELINQUENT SALE NOTICE.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

NOTICE—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the 26th day of October, 1894, the several amounts set opposite the names of the respective shareholders, as follows:

	No. Certificate.	Shares.	Amount.
W. T. Robinson	7	25,000	$1,250 00

And in accordance with law, and an order from the Board of Directors, made on the 26th day of October, 1894, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Room 56, No. 309 Montgomery street, San Francisco, California, on THURSDAY, the 27th day of December, 1894, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. STADTFELD, JR., Secretary.

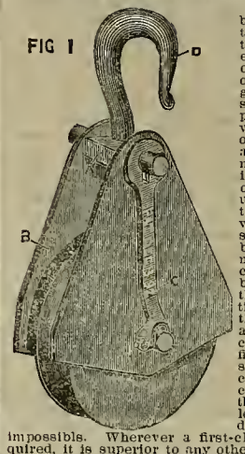
IMPROVED STEEL SNATCH BLOCK.



This is admitted by experts to be the best block of the kind in existence. Being made of the best quality of refined steel, it gives greater strength in proportion to its weight, and the opening side being a solid piece, does not detract from its strength as in other blocks. In using wire cable, the damage to which the cable is subject in other blocks by jamming between the cheek plate of the block and rim of the pulley is entirely overcome, as the guiding ribs B, as shown in the cut, are snugly fitted to the inner surface of the cheek plates and completely enter the rim of the pulley, making accidents of this kind impossible. Wherever a first-class block is required, it is superior to any other. *Catalogues sent free.* Address, CALIFORNIA STUMP PULLER CO., 82-84 Zoe Street, San Francisco, Cal.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes wherof he knows from personal practice, and in such plain and comprehensive terms tbat neither the scientist or the practical miuer can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Preface; Introduction; Implements: Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing tbe Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents:—Gold and Silver Bullion; Appatus; Melting Bullion; Assaying Bullion; Hnuid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by The Dewey Publishing Co., Publishers, 220 Market St., San Francisco.

ANNUAL MEETING.—THE REGULAR ANNUAL meeting of the stockholders of the Gould & Curry Mining Company will be held at the office of the company, room 69, Nevada block, 309 Montgomery street, San Francisco, Cal., on MONDAY, the 14th day of December, 1894, at the hour of 1 P. M., for the purpose of electing a Board of Trustees to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Friday, December 14, at 3 P. M. ALFRED K. DURBROW, Sec.

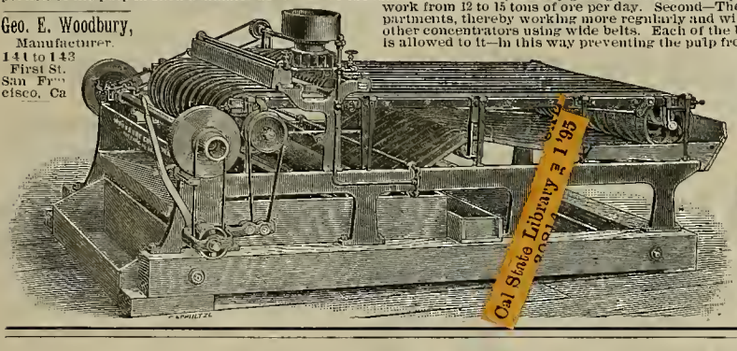
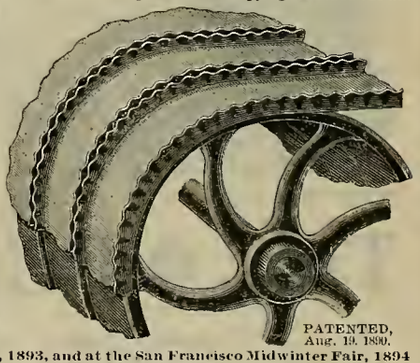
THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer. 141 to 143 First St. San Fr... cisco, Ca



Cal State Library



PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1894

AND PACIFIC ELECTRICAL REVIEW.

VOLUME LXIX. Number 25. SAN FRANCISCO, SATURDAY, DECEMBER 22, 1894. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Anaconda Mines and Works.

The largest copper smelting property in the world is at Anaconda, Montana. During the past eleven years the magnitude of the plant and its results have been steadily increasing, till now the employes are numbered by the thousand, and the business aggregates over a million dollars a month. About 4000 tons of ore are daily treated at the smelters, which are in continuous operation. The works constitute a little town in themselves, comprising a large number of different divisions, each subdivided into details corresponding with the requirements of the process of taking the ore from the car and turning it out merchantable copper. The concentrator alone is of vast proportions; the smelter and furnaces cover acres of ground; the eighty tank houses, power houses, store rooms, offices, etc., occupy a large area, and, in connection with this, is the proposed great converting plant, to cost over a million dollars, and intended to be the largest and most complete institution of the kind in the country. The company's thousands of men are also employed in the Anaconda mine, near Butte, and adjacent mines, in their coal mines, fire brick, coke, etc., the payroll exceeding that of any other mine in the United States.

UPPER WORKS OF THE ANACONDA SMELTING CO., ANACONDA, MONTANA.

We are indebted to the *Montana Mining and Market Reporter* for the three cuts which herewith illustrate a portion of Montana's great industry. From 1885 to 1892 inclusive the Anaconda Mining Co. has extracted from the mines in Butte district over 450,000,000 pounds of copper. Everything is on a gigantic scale and constitutes an important factor in the great industrial interests of the State.

THE ANACONDA MINE.

A PORTION OF THE WORKS.

REGARDING the much talked-of trust or combine among the Colorado smelters, one of the members of the Bi-Metallic Smelting Co. of Leadville naively says: "The life of the combine will depend on the miners themselves." Just so: if they stand in, they will narrow their own market and then must do the combine's dictation. Otherwise, otherwise.

T. A. RICKARD says: "A 'veiu' is a fracture in the rocks carrying ore; when such a fracture cuts across the bedding planes of the country it is styled a 'true fissure vein;' when the fissure vein is not inclosed by a single rock formation but has one wall of one kind and the other wall of another kind of rock, then it is a 'contact fissure vein.'"

THE Bunker Hill and Sullivan mines at Wardner are still at a deadlock. Two adverse suits against the company are pending in the United States Court. The Miners' Delight mine in the Yreka district, Shoshone county, Idaho, is involved. J. A. Campbell is the plaintiff in one suit and Jno. Downs in the other. The plaintiffs allege that the Miners' Delight overlaps four of their lap claims, the joint overlap including all of the Miners' Delight. The case will bring out many interesting legal points. The plaintiffs claim prior location in the Downs case, and allege in the Campbell case that the Bunker Hill people failed to comply with the law respecting assessments.

AN exchange has the following sound advice: Whether you fight or work, don't make too much fuss about it. The hen cackles after she has laid her eggs. The noise and sizzle of the locomotive are not force. All force is silent. The hee-haw of the mule may startle you—but it is not nearly so dangerous as his hind legs. Bear in mind that it is the empty wagon that rattles most when in motion. The noise of the drum is due to the fact that there is nothing in it. Bear in mind that you can't startle the world by jumping up and hollering "Boo!" Thought is the great motive power, and don't you fall into the mistake of believing otherwise.

FOR some months negotiations have been in progress for the sale of the Weber group of mines, five miles from Fairview, Idaho, and the milling plant and property in the town, and the deal is now considered practically closed. It involves the reorganization of the company, with ex-Governor Russell Alger of Michigan as president, and W. D. Preston, cashier of the Metropolitan National Bank of Chicago, as secretary, the Weber brothers retaining a considerable block of the capital stock. The consideration is not announced. The Weber group includes five claims, all being worked by a tunnel half a mile long, and considerable machinery, together with a combination gold and silver mill at Fairview. It is said that the new company will build a road from the mine to the mill next summer and make other improvements. The company has water power at its disposal, and is considering the proposition of using electricity to propel the proposed line.

MENTION was made last May of a party of miners, assayers and explorers who, under the leadership of A. R. Hammond, were going to Southern Africa there to seek for tune in that far-off El Dorado. They went, to the number of twenty-five. Now they are returning. A few remain there, and, while it is to be hoped they will do well, for enterprise and courage deserve success in all events, yet, unless a man is of extraordinary ability, has considerable influence, or has the promise of something lucrative, it is doubtful policy to spend so much time and money in that way, especially in leaving a State in which the expenditure of the same amount of coin and energy would insure far more satisfactory result.

BUT a few days remain in which to record non-assessment notices. Owners of mining claims who have not already taken advantage of the chance to save $100 should remember that the time for recording such notice expires the 31st of this month.

ENGLAND has no silver mines, but wants cheap silver. No direct shipments of silver were made to the United States from India during the past fiscal year.

MINING SUMMARY.—From the Various Counties of California. Nevada and Other Pacific Coast States and Territories, 394-395.

FOR the twenty-ninth time the MINING AND SCIENTIFIC PRESS wishes its readers a merry Christmas.

STEEL rails are quoted now at $22 a ton, a big comedown from the days when $150 a ton was paid.

FREQUENTLY, says *Printer's Ink*, the most expensive space is the cheapest. It's how many dollars' worth of goods do yon sell in proportion to the cost of your advertisement, and not how much does yonr advertisement cost yon per line.

THE *Montana Mining and Market Reporter*, three months old, and a very creditable looking jonrnal, thinks that a mining paper that stands up for the mining interests of the section it represents should have the preference in the publication of mining notices over any and all publications, daily or weekly, and makes logical argument thereon. It is a question that has been argued a good deal, and never yet satisfactorily settled.

An Extensive Plan.

The last State Legislatnre created a new office—Commissioner of Public Works—and the incumbent, Mr. A. H. Rose, has submitted his first annual report to the Goveruor. A partial outline of the report, so far as it related to hydraulic miniug, was given in these columns last week, as presented to the Executive Committee of the California Miners' Association at its recent meetiug.

Regarding the reclamation of river and swamp land, the commissioner thinks that the lack of a general uniform system is the cause of the failure of present levee systems. Levees should be under Government control, and cross levees should be provided with floodgates, and flood channels through the valleys should be made. He recommends that the Yuba, Bear and American rivers be turned into the American basin, a swampy depression declared to be undrainable. This plan, it is believed by the commissioner, would enable the hydraulic miners to operate along the banks of those rivers. Miniug debris would spread over the swamp and iu course of time make new and valuable land. This, says the commissioner, would put an end to the great question of disposing of hydraulic mining debris.

The report shows that since 1855 the State has paid out $3,191,588.20 in reclamation works; the United States Government, $1,061,750, and the organizers of various drainage districts, $14,783,464, making a total of $19,036,802 expended without anything like commeusnrate results. The commissioner is of the opinion that the cost of the proposed work should be borne by the General Government by direct appropriations from the general treasnry, and the construction to be under the direction and supervision of the California Debris Commission. Recommendation is made for an appropriation of $50,000 to collect data for the extension of the work to the San Joaqnin valley. From Augnst 12, 1893, to December 1, 1894, the expenditnres of the Public Works Commissioner's office were $25,156.82, leaving an unexpended balance of $4843.11. The report inclndes a personal report from Messrs. Manson & Grnnsky, the consulting engineers, who present estimates of what the carrying out of their proposed drainage and protection works would cost, the total being set at $9,287,000. They state that there are 1,090,500 acres of land subject to innndation within the area which would be benefited, the valne of the property being about $100,000,000. Of this acreage all but abont 50,000 acres, they estimate, would be completely reclaimed, and nearly all of that would be available for pastnrage, etc. The proposed plan of reclamation and protection comprises the enlargement and ntilization of the river channels to their maximnm capacity as drainways; the ontflow of snrplus waters from the river channels at selected points, and control of the snrplns water between embankments forming by-pass channels and a rapid delivery of the same into Suisnn bay. Of these escape-ways, they snggest that one should traverse the Colnsa basin, returning to the river at Knight's Landing; and that others should be located in the Yolo basiu, the Bntte basin, etc., their combined effect being to keep the waters of the river always nnder complete control.

Progress of the Work.

At the recent convention of the Cal. State Miners' Association it was determined to take snch action as would check aud permanently prevent the acqnisition by railroad companies in this State of nnpatented miueral lands which lie within the limits of land grant and indemnity land grant limits. The subject was thoroughly discnssed, and President Neff appointed a committee "for the protection of mineral lands from railroad grants," whose dnty it was to be to "appear before the Department of the Interior by memorial and by agent, to endeavor to stop the patenting of mineral lands to the snbsidized railroads; also, to obtain an order from the Commissioner of the Geueral Land Office that the bnrden of proof that land claimed as agricnltnral by the railroads shall be placed on those corporations, in accordance with the decisiou of Justice Field in the Barden case" in Montana.

The committee is moving in the matter and, as a preliminary, is having prepared maps of the lands lying within railroad grants in this State. Under date of the 13th inst., the gentleman to whom has since been delegated the work of preparing such map writes as follows:

A. H. Ricketts, Esq., Chairman of the Committee for the Protection of the Mineral Lands, San Francisco—DEAR SIR: In compliance with your instructions given to me yesterday, I have made examination into the obtaining of data for the presentation, in concise form, of the lands lying within the railroad grants within this State, and beg to report to you as follows thereon:

That, in my opinion, the most convenient method would he to prepare maps, which would show tbe boundaries of the townships and sections, the principal streams, topographical features; also, in distinctive colors, the boundaries of the various railroad grants, the presumed boundaries of the most important mineral lands.

I propose to make this map on a scale of one and one-half inches to a township and one-quarter of an inch to a section. It would require two maps, one of which would include the territory from about Santa Cruz on the south to the Oregon boundary on the north and from the Nevada boundary on the east to sufficiently far west to include the Oregon railroad grant. This map would he about five feet hy three and one-half. The other map would include the southern portion of the State from a little north of Los Angeles, perhaps to the Mexican boundary, and from the ocean to the Colorado river. This last map would he about three feet hy four. The maps could he hlack printed and any given numher of maps could he made from each at a nominal cost.

I estimate that it would require for the completion of the maps at least two weeks, without marking thereon the railroad selections, which would take a week or ten days more time. These maps will show graphically and at a glance the status of the matter.

As soon as these maps are ready (which will be abont Jan. 1st) the committee will have something tangible on which to prepare its case. Meanwhile an effort is making to have the President or the Secretary of the Interior issue an order suspending the issuance of any and all patents of the natnre protested against till the committee has opportunity to show specific canse why such action is at variance with the better and broader interpretation of public requirements.

When Congressman Caminetti addressed the convention he said: "Along the liue of the Pacific railroad grant to-day patents are being issued to the railroad for lands that are actually mineral and ought to be given to the miner. Unless you stop that work yon will lose the opportunity of getting the valuable mines that are now npou this land."

The total amonnt of the S. P. land grant in California is 1,638,000 acres. To Jnne 30, '94, 491,000 acres had been patented, and on that date there were pending selections already approved by the officers and only awaiting final decision of the Secretary of the Interior and the President's signature patents to 414,500 acres, the remainder not yet located and snrveyed aggregating 732,000 acres. On the 19th inst., the Secretary of the Interior approved clear lists of lands as the basis for land patents to the Northern Pacific Railroad, embracing 91,414 acres within the Cœnr d'Alene and Lewiston land districts of Idaho; to the Southern Pacific, embracing 19,190 acres near Los Angeles; to the Southern Pacific, embracing 47,506 acres within the primary limits of the company's grant in California, and to the Central Pacific, covering 33,759 acres in the neighborhood of Salt Lake City.

To stop snch issnance of patents to the railroad company for the remainder of those 414,500 acres till the miners' side of the case can be heard is the present effort of the committee.

What is known as "the Idaho-Montana bill" has passed the Honse and is now before the Senate. A similar bill has been introdnced in the Honse by Congressman Caminetti, anthorizing the Secretary of the Interior to canse all nnpatented lands in this State within the land grant and indemnity land limits of the Central Pacific Railroad Company to be examined and classified by six Commissioners appointed from the Sacramento and Marysville districts by the President of the United States, with reference to the mineral or non-mineral character of the lands, the Commissioners to have power to cancel any and all claims heretofore, and which may be made hereafter, on behalf of the Ceutral Pacific Railroad on any nnpatented lands in the State, which npon examination shall be classified as mineral lands. The bill provides that all nnpatented lands in this grant shall be taken to be mineral lands which, prior to the passage of this Act, have been located or patented as mineral lands, or which have, or will have, a market value by reason of the minerals which they contain, or which show snch indications of deposits of valnable minerals as would indnce a miner to spend his time and money upon them, or which, from their geological formation or location in a well-defined mineral belt, will probably be valnable for minerals. On snrveyed lands the classification is to be by sections, and on nnsnrveyed lands by tracts, with snch artificial or natural boundaries as the Commissioners may determine.

Where locations have heretofore been made, or patents issued for mineral ground in any section of land, this shall be taken as prima facie evidence that the forty-acre snbdivisiou within which it is located is mineral land, bnt the word mineral in this bill does not inclnde coal or iron. A report of lands classified by the Commissioners is required to be furnished to the Registrar of the Land Office in the district in which they are situated, and this report mnst be published in some county paper for four consecntive weeks. Parties aggrieved by the classification of the Commissioners may appeal to the Land Office officers aud to the Commissioner of the Land Office, as in case of land contests.

One trouble with the bill seems to be that its provisions apply only to the Sacramento and Marysville land districts and the C. P. land grant. There are other districts wholly unmentioned, and other California railroad corporations beside the C. P. That bill needs amending. Its scope appears to be too limited to render the desired relief.

The Association, through its committee, is going abont the matter promptly and in the right way, and deserves the hearty and substantial support of those for whose rights it is working and who are most vitally interested in the results.

Concentrates.

THERE are about sixty men working at the Thistle shaft, Plumas county.

THE Poorman-Consolidated is to be Anglicized, and the directors hope for better things.

ON the Le Roi, Trail creek, B. C., a body of ore forty feet square was found at the surface.

THE James mill in Pioneer district, Amador Co., recently destroyed by fire, is to be rebuilt.

THE Homestake Mining Company's latest $25,000 dividend makes a total to date of $5,312,500.

THE mines around Jackson, Amador Co., are now paying out about $40,000 a month for labor alone.

THE Blue Jay mine, Butte, Montana, has been sold to the Butte and Boston Company for $75,000.

THE Gilt Edge mine and mill in Fergus county, Montana, has started up with a force of thirty men.

THE Nevada State Exhibit at the Midwinter Fair cost $13,985.24, of which $11,748.50 was subscribed.

J. B. HAGGIN has sold the Aurora Borealis mine near Virginia City, Montana, to J. McParlane for $10,000.

THE October and November cleanups at the Alaska-Treadwell show that 52,754 tons of ore yielded $89,073.

THE mill to be built at the Oro Fino mine will be 2000 feet from the mine on Deer creek. It will have forty stamps.

THE Montana Mineral Land Development Company is about to build a concentrator on the Eva May mine near Basin.

THE snow slide at the English Mountain mine near Graniteville will cause the suspension of work there for the winter.

THE La Cananea copper mine in Sonora, Mexico, has been sold by the widow of Gen. Pesqueira to Americans for $90,000.

BARON SWANSEA, owner of the vast smelting works at Swansea, Wales, who was in this country this summer, is dead.

THE superintendents, miners and business men of Virginia City have contributed $2101 for the orphans of St. Mary's school.

WORK at the Golden Feather channel mine, near Oroville, has closed for the winter with promise of good results next spring.

THE Ajax Mining Company of Tintic, Utah, has decided to build a concentrating plant with which to work their second-class rock.

T. F. HYNES of Philipsburg, Montana, has foreclosed a mortgage for $54,225 against the Puritan Mining Company of Granite county.

THE Great Falls Reduction Works are treating a large quantity of ore mined on Trail and Twelve-Mile creeks and around Kaslo, B. C.

IN Nova Scotia, for the nine months ending September 30th, 47,330 tons of gold ore were crushed, yielding an average of seven dwt. to the ton.

IT is probable the gold output in the Witwatersrand mines for '94 will aggregate 2,000,000 ounces. For the first ten months it was 1,668,761 ounces.

A CARLOAD of ore from the Gray Eagle mine, Squaw creek, Washington, was shipped to the Everett smelter, and the returns were $187 in gold to the ton.

THE copper mines of Butte are all in full blast and the smelters, both there and in Anaconda, are taxed to their full capacity to keep pace with the mines.

THE twenty-stamp mill at the Springfield mine, in El Dorado county, has been sold to the owners of the Richmond mine, near Plymouth, and taken there.

THE Daisy Hill mine, near Grass Valley, has a fine plant and a ledge of free-milling gold ore that encourages the owners in the just belief that they have a bonanza.

A CONTRACT for sinking the main shaft at the Virtue mine, near Baker City, Or., 100 feet deeper has been let to a company of nine Cornish miners, at $20 per foot.

MRS. E. C. LOFTUS of Sonora, Tuolumne Co., aids in the superintendency of the Golden Gate mine, which is reported to yield a yearly profit of $168,000, and does it well.

AT the annual meeting of the Andes held last Tuesday the old officers and board of directors were re-elected. The financial report showed a balance of $9300 in cash on hand.

THE Crevasse Mountain Mining Company has suspended operations at their mill in Crevasse, Park county, Montana, for the winter on account of insufficient water supply.

THE Nevada City *Herald* says the Champion mine intends to run to its full capacity. In a short time there will be as many men employed there as there were before the shut-down.

THE Salt Lake City Copper Works will shortly be in a position to fulfill the promises which it has been making for two years and push the great copper plant to a speedy completion.

AT a depth of 300 feet on the Paymaster, on the American side of the Okanogan, the pay streak averages sixteen inches in width and runs from $60 to $1000 to the ton. Considerable free gold is found.

THE Cumberland carbonate mine at Castle, Montana, has been sold at receiver's sale to J. K. Tod of New York, one of the former owners. The property is equipped with an expensive hoisting plant.

THE Duck Creek Mining Co. has incorporated at Spokane, Wash.; capital stock, $1,000,000. Incorporators—J. F. Sloane, P. Richmond, G. M. Forster of Spokane, C. M. Reese, J. H. Field of Minneapolis.

THE Big Canyon Mining Company, near Placerville, Cal., are preparing to increase the size of their mill to a capacity of thirty stamps by adding ten new ones. About forty men are employed at the mine at present.

THE Bellingham Bay Hydraulic Mining Co. has incorporated at Fairhaven, Wash.; capital stock, $30,000, with shares at $50 each. Incorporators—L. W. Nestelle, F. J. Hamilton, H. A. Compton, C. C. Taylor, W. Hedge.

DURING the month of November there were 163 quartz lode location notices filed for record with the recorder of Jefferson county, Montana, and eighteen placer location notices. There were also 126 non-forfeiture notices filed.

STIPULATIONS dismissing the appeal in the case of the Champion Mining Company, appellant, vs. the Consolidated Wyoming Gold Mining Company, appellee, were filed in the United States Circuit Court of Appeals last Wednesday.

THE Butte, Montana, *Inter-Mountain* says the concentrates from the Kutie mine at Basin continue to surprise the mining men of that section. They average $2800 in gold to the ton, and frequently show up nuggets of free gold as large as a pea.

AT the Seth Cook mines, near Coulterville, Mariposa Co., in which section capital from everywhere in the Union, except San Francisco, is being invested, two three-compartment shafts are being sunk. A twenty-stamp mill is next is order.

THE Denver *Record* declares that W. S. Stratton is preparing to hoist a million dollars' worth of rock from his Independence mine in a single day. He thinks the rich sylvanite ore recently encountered in the lower level will enable him to do it easily.

The Bridgeport Mining and Milling Company of Okanogan county, Wash., have a fifty-horse power steel locomotive boiler, a forty-horse power or five-drill capacity air compressor, a double hoisting engine and twenty-horse power boiler, and other new machinery.

THE Mohave *Miner* says the bars of the Colorado river are to be worked for the gold in their shining sands, but gives no particulars of the project. An hydraulic process of working the bed of the Colorado river would contribute considerable gold annually to the world's supply.

FOR the week ending Nov. 15th, at the Broken Hill Proprietary silver mine, Australia, 10,382 tons of ore were treated, yielding 910 tons of lead, containing 242,896 ounces of silver, also 1111 tons treated by amalgamating and leaching plants, producing 16,142 ounces of silver.

THE Godfrey Gold and Silver Mining Company has filed articles of incorporation in this city. Capital stock, $2,400,000. Organized to do a general mining business in Tuolumne county. The stockholders are E. L. Lowe, T. G. Maguire, E. Maguire, S. Lowe and L. W. McGlanflin.

DR. HENRY WURTZ figures nine-tenths of a grain of gold in each ton of sea water, and thus computes that the entire ocean contains over $80,000,000,000,000,000 of gold. One of the problems of the future, Dr. Wurtz predicts, will be the getting of some of this gold by electrolysis.

DURING eleven months of the present year Wells, Fargo & Co. transported from Kingman, Arizona, in gold bullion $11,660, and $47,650 in silver bullion. The A. & P. transported 350 cars of gold and silver ore to Eastern smelters, the aggregate value being in the neighborhood of $1,008,000.

THE annual report of the Oro Preto Co. (Brazil) shows the value of the gold produced during the term covered by the report to be $22,500—more than the aggregate of the preceding year. Of this $5000 was due to the better quality of the ore and $17,500 to the improved method of treatment.

AT the Yellow Jacket mine, 75 miles north of Challis, Idaho, a 40-stamp mill is building. The ore is free milling and averages $12 to the ton. The Columbia Hill Co. is also doing considerable preparatory work. It is thought that the 300 men now there will be increased to nearly 1000 next spring.

THE Sutro Tunnel Co. has settled some of its litigation. Pierson & Mitchell sued for $9000 for legal services; they settled for $6000. E. Tausky, another lawyer, wanted $22,000, but took $17,000. The royalties earned from the mining companies will be used to liquidate the claims as now arranged.

THE Crocker-Woolworth Bank last week received a lot of gold bullion from the Hidden Hill mine, near the Needles, San Bernardino county. The gold is very pure and was taken from a point less than twenty feet below the surface. The richness of the find has created a sensation in the region of the Needles.

AMONG mining dividends of the month are the Con. Cal. and Va. of $54,000 last Thursday; the Tamarack Copper Co., $4 per share, payable on the 31st; the Rico-Aspen Co. of Colorado, $25,000, on the 10th; the Standard Con., ten cents per share, on the 20th, and the Homestake, twenty cents per share, payable on the 26th.

LAST week a slide occurred above the big tunnel at the Gold Bank mine at Forbestown, Cal., which covered the mouth of the tunnel to a depth of about thirty feet, demolished the blacksmith shop, destroyed machinery, cars, etc., causing a damage of about $1000. The distance of the slide was about 300 yards.

OF the numerous mining companies operating in the Black Hills, but few give publicity to their product or profits. There are seven companies in Lawrence county, nearly all located in Whitewood quartz mining district, that have distributed among their stockholders $7,909,000 in dividends, and they keep on adding to the amount every month.

MRS. HETTIE GREEN, the richest woman in the United States, is the principal owner in the Amador Consolidated mine on Sutter creek. Millions of dollars were taken from that "old Hayward mine" as it was called, and it is believed to be a very rich mine yet. It has been idle for seventeen years, and the 2200-foot shaft is full of water.

W. G. RIFENAURO, an old-time smelting man and miner, would put in a thirty-ton smelter at the Needles if he could get the lease of the reduction works. He has a smelting plant now idle at San Diego, which he had removed from Ensenada, Lower California, being forced out of business by the excessive taxes and duties imposed by the Mexican government.

A CERTIFICATE OF INCORPORATION of the New Southern Cross Company has been filed in Butte, Montana, by Sophronius Marchesseau, Octavius Hight and Cornelius P. Drennan to carry on mining and milling business; capital stock 412,000 shares of assessable stock at a par value of $3 per share, operations to be carried on in Deer Lodge and Silver Bow counties.

THE celebrated Last Chance mining case has been set for final determination in the Supreme Court of the United States on the first Monday in March. The suit which has been running for years in the lower courts involves the title to mining interests in the Cœur d'Alene district worth $500,000. The Last Chance men recently had the verdict in the lower court set aside.

COULTERVILLE, Mariposa county, is reported to be lively. Lots in the town that two months ago were valued at $200 and $300, with no purchasers, are now being sold for $1000 and upwards. Men awaiting the opening of the mines are camped in tents along the gulches and ravines in large numbers. Rents are high and all buildings are occupied.

ONE or two Montana papers, in estimating the United States gold production for '94, give Colorado first place and Montana second place in the list of gold producing States. As a matter of fact California leads in '94 as in other years. In '93 the gold yield was about $12,500,000. This year it will approximate $15,000,000, over one-third of the entire product of the country.

AT last Monday's meeting of the Cal. Debris Commission the applications of John Black of the Spanish mine and E. P. Hager and Samuel Peck of the Blue Tent mine, Nevada county, for permission to commence hydraulic operations were granted, satisfactory dams having been built. The applications of G. H. Pease and J. B. Colwell of Placer county were taken under advisement.

AN extensive program is mapped out for itself by the International Metal Co., which has organized at Albany, N. Y., with $1,000,000 capital stock, "to mine all metals except gold and silver in Colorado, New York, Idaho, Montana, Nevada, California, South Dakota, New Mexico, Arizona and Utah, in the United States; Coahuila, Chihuahua and other States of the Republic of Mexico."

AFTER paying all expenses for the past fiscal month the Con. Cal. & Virginia Mining Company had in its treasury a net surplus of $214,959.08. After the monthly dividend of 25 cents per share, amounting to $54,000, was paid last Monday, there remained $160,959.08, or a sum nearly equal to three more dividends of the same amount. The Morgan mill has resumed crushing ore from the mine.

CONSIDERABLE interest, says the *Tribune*, is being taken in the professions of the Bradford process of treating ore. Tests are now being made by its promoters of carload lots of ore from half a dozen of the large mines, both gold and silver. If the results which the test of the Mercur ore yielded can be shown to be obtainable on all grades of ore, a revolution in mining in Utah may well be deemed imminent.

THE War Eagle Mining Co., incorporated at Spokane, Wash., with $500,000 capital, proposes to buy, lease, bond, hold and operate mineral properties in the United States and British Columbia; to construct, maintain and operate concentrators, mills, reduction works and smelters. The trustees are P. Clark, A. Corbin, W. J. C. Wakefield, A. T. Herrick and B. C. Kingsbury, Spokane; and J. A. Finch and A. B. Campbell, Wallace, Idaho.

THE Golden Jack Milling, Mining and Development Company has incorporated at Trinidad, Col., for operations at La Belle; capital stock, $300,000. The officers are John Mayer, president; N. F. Gagnon, secretary; C. E. McCarthy, treasurer. The managers of the company expect to have one or more producing mines in operation by spring. Assays received from two lots of fifty pounds each, taken from the Little Mollie, give returns of $43.20 per ton.

THE *Leader* says the laborers of the Gladie mine at Sierra City compelled one of the managers, who went up from this city, to sign a note for the total amount of their wages, amounting to $1500, last Monday, before they would permit him to leave for Downieville. This was an illegal procedure and the note is invalid, because it was signed by compulsion. The company is an incorporation and their indebtedness is good, in case the mine is attached.

THE St. Joe and Mineral Farm Consolidated Mining Company and the Pontiac and Champion Empire companies of Aspen, Col., propose to consolidate into a new company, capitalized for $3,000,000 in one dollar shares, one million shares to be treasury stock. Of the remaining two million the St. Joe and Mineral Farm is to receive half, the Pontiac 33⅓ per cent and the Champion Empire 16⅔ per cent. It is intended to put the treasury stock up at 25 cents or more, to raise money for development.

IT is figured that the Pilot Bay smelter will employ 109 men at an aggregate daily wage of $307.50, and will daily require 20 tons lime rock, 40 tons iron ore, 30 tons charcoal and 12 cords wood, worth $590, making a total of $897.50 per day paid out; and that the works will be in operation about December 15th. Ore is being taken out in many of the smaller mines and will be shipped forward as soon as the smelter starts up. D. W. McVicar of Nova Scotia has leased the Number One, near Ainsworth, and taken an option on the concentrator.

AN agreement is reported concluded between the Anaconda and Calumet and Hecla companies, under the terms of which the former company undertakes to reduce their production to the level of the latter company—say to about 5,500,000 lbs. per month. As in the month of October the Anaconda company produced 9,300,000 lbs., this reduction represents about 1500 tons per month. The production of the other three leading Montana companies in October was 6,100,000 lbs., and that of the other leading Lake Superior company—the Tamarack—900,000 lbs., these figures about representing the extent of their present capacity. It is believed that the Rio Tinto company have agreed not to increase their production. Copper shipments to Europe continue on a reduced scale, being about 4000 tons for November, making the total for eleven months of this year about 69,552 tons against 70,903 tons in the same period last year. As 22,000 tons less have been shipped in the five months from July to November this year than last, it is evident that the private stocks of American copper held on the continent must now be less than at this date in 1893, the public stocks in England and France showing an increase of 6068 tons. Consumption both in this country and in Europe must have been much larger this year than last, and seems likely to improve.

Personal.

C. W. MERRILL, formerly of Bodie, is putting up a cyanide plant at Harqua Hala, Arizona.

J. B. STETSON has been chosen president of the Edison Light and Power Company, to succeed the late Geo. Roe.

LIEUT. C. E. GILLETTE, of the Debris Commission, has returned from a visit of inspection from San Francisco at Rough and Ready.

ROBERT STIGHT has resigned as metallurgist at the Golden Sunlight mines at Whitehall, Montana, to accept a like position on an Australian mining property.

Utah Variscite Mines.

To the Editor:—Some time ago I visited the variscite mines discovered November, 1893, near old Camp Floyd, Utah Co., Utah. This is the first of this mineral discovered in this form in the United States and, as to quality, is the finest in the world. It occurs reniform, and the country rock in which it is found is metamorphic limestone, through which run ribbons of hard black quartz. The gems vary in size from a small plum to an occasional one as large as an ostrich egg. The matrix in which the gems lie is an oxidized iron silt, although we sometimes find them imbedded in the narrow quartz veins and adjoining limestone. The nodules upon being removed from the matrix are very unpretending looking objects, resembling half-decayed Osage apples; but upon removing the clayey coating we find a yellow coating, being luminar and of an agatized nature. This around an average-sized nodule is from an eighth to a sixteenth of an inch in thickness. Under this last coating we find the variscite, like the kernel in a nut. Its color varies from light to dark green; we find shades of sea green, pea green, emerald, and some as dark as olive. As a gem it is susceptible of high polish and possesses rare and striking beauty either for jewelry or for the cabinet of the collector. Unfortunately it does not occur in great quantity; for this reasou it can never be possessed save by the few fortunate collectors. Its very existence adds to the wealth of American minerals.

In mining for the nodules of variscite, the greatest care must be taken lest an unlucky stroke of the pick may strike and destroy a valuable jewel, and although the little silt veins in which they rest are narrow and few, and the rock enclosing them being of an unyielding and refractory nature, very little blasting can be done owing to the danger of shattering the nodules contained in the vein matter. In this way it will be seen that the work of securing the sparsely scattered jewels is slow and difficult, but he who, even with great labor, secures one of a few ounces, possesses a valuable and rare accession to his cabinet.

The discovery of this mineral has been made note of by different American and foreign journals devoted to science and mining, but no descriptive report has been given to the general public, as might be expected upon the discovery of a rare or beautiful "find."

The locality containing it is a spur of the Oquirr range of mountains in central Utah; the spur is a low, short tongue extending out from the east base of the range, near a pass that leads into Rush valley from Cedar valley. It lies on the entrance to the great American desert and is only about three and one-half miles northwest of old Camp Floyd, where the army of Utah, commanded by Albert Sidney Johnson, was encamped by the side of the Big Springs from the year 1857 to 1861.

Six miles to the northward there are gold mines, among which is the famous Mercur mine, the output of which is treated by the cyauide process. At the variscite mine the scene is wild and desolate. A few stunted cedars grow arouud on the hills. To the hill on which the mine of variscite lies, the name of Chapultepec has recently been given. This was prompted by the idea conceived by many that this lovely green stone was in some way connected with the jewels of the Aztec emperors of Mexico, whose magnificent green gems of Chalchihuitl became the admiration of the courts of Europe, aud very few of which are known to exist. I found, to my regret, that there were no signs of ancient excavatiou upon the ground. If such work was done, it was carefully covered over by the ancient workers. Near by I discovered two mealing stones, such as were used by the extiuct races of southern Utah and Arizona, and the same as are now used by the lower classes in Mexico and known by the name of metate. Three miles to the southward, near the pass, I found very interesting picture writings, etched there doubtless in the vauished ages by the lost race whose remains are so abundant in the deserts of the Southwest, and perhaps we may yet find proof that the variscite mines of this region were known and worked by those same people and that the famous jewels now lying in the ethnographic museums at Rome (Italy) and Berlin were once taken from this wild and weird spot, where the genii of wealth stored their treasures at creation's dawn.

A short report was made upon this Utah variscite in the early part of the present year by Prof. Henry Montgomery, then of the Utah University; also by Dr. James E. Talmage and by Prof. Merrill of Washington, D. C. Its analysis is little different from that of turquoise, save that where copper is the coloring agent in turquoise, that in variscite is found to be manganese and iron. The structure is largely hydrous aluminum phosphate, which, upon being exposed to intense heat, changes from green to a beautiful pink or sometimes purple. Don Maguire.

Ogden, Utah, Dec. 5, 1894. 549 Twenty-fifth St.

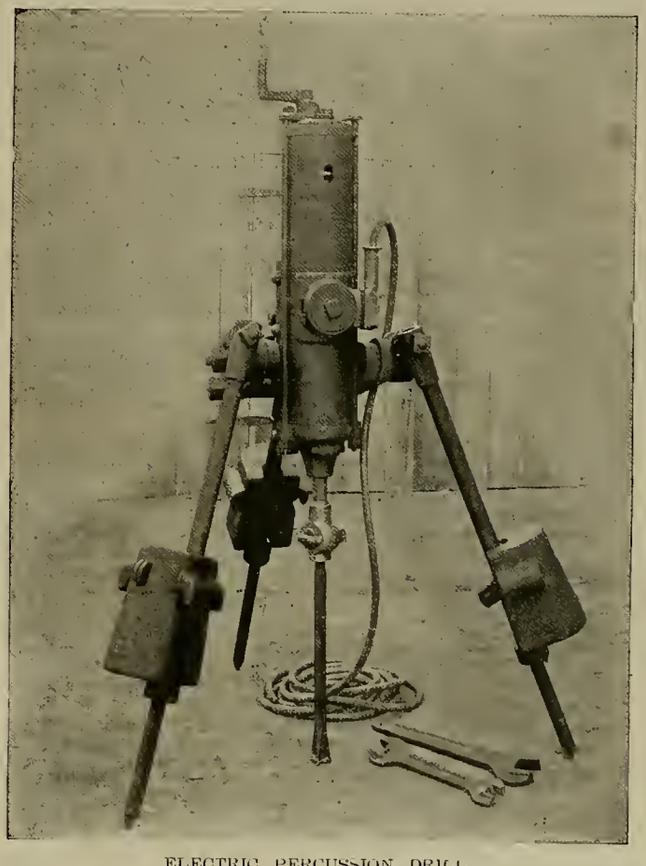
Thirty feet is the usual length of steel rails. But the Lehigh Valley has decided to adopt forty-five hereafter, except in tunnels, where ninety will be the standard.

Electric Percussion Drills.

The accompanying illustration shows a type of electric percussion rock drill made by the General Electric Co.

In general external appearance the electric drill conforms very closely to the regular types of steam and air drills—in fact, the tripod and shell complete are of the standard steam drill form.

The drill body includes two energizing coils, with



ELECTRIC PERCUSSION DRILL.

mica insulation. Within the magnetic fields of these coils is a reciprocating pistou which is forged in one solid piece with piston rod and drill chuck. The piston is provided with the standard air drill rotating rifle-bar and the usual form of sprinugs to protect the front head of the drill from blows. The drill consumes about seven and one-half horse power at 220 volts, and is operated on a three-wire circuit from the generator.

The total horse power of the engines of the world, not including locomotives, of which there are 105,000 with a total horse power of 3,000,000, is 46,000,000, which represents all the force that could be exerted by 1,000,000,000 men, or more thau twice the total working population of the entire globe.

Free Entry.

The following articles have free entry into the United States: Photographs, maps, charts (printed more than twenty years at the date of importatiou), hydrographic charts, scientific books and periodicals devoted to original scientific research, and publications issued for their subscribers by scientific and literary associations or academies, rough Brazilian pebble, emery ore, glass plates or discs, rough-cut or unwrought, for use in the manufacture of optical instruments, spectacles and eyeglasses, and suitable only for such use: *Provided*, however, that such discs exceeding eight inches in diameter may be polished sufficiently to enable the character of the glass to be determined, ivory and vegetable ivory in the rough, magnets, philosophical and scieutific apparatus, utensils, instruments and preparations, including bottles and boxes containing the same; and paintings, drawings and etchings, specially imported in good faith for the use of any society or institution incorporated or established for philosophical, educational, scientific, or literary purposes.

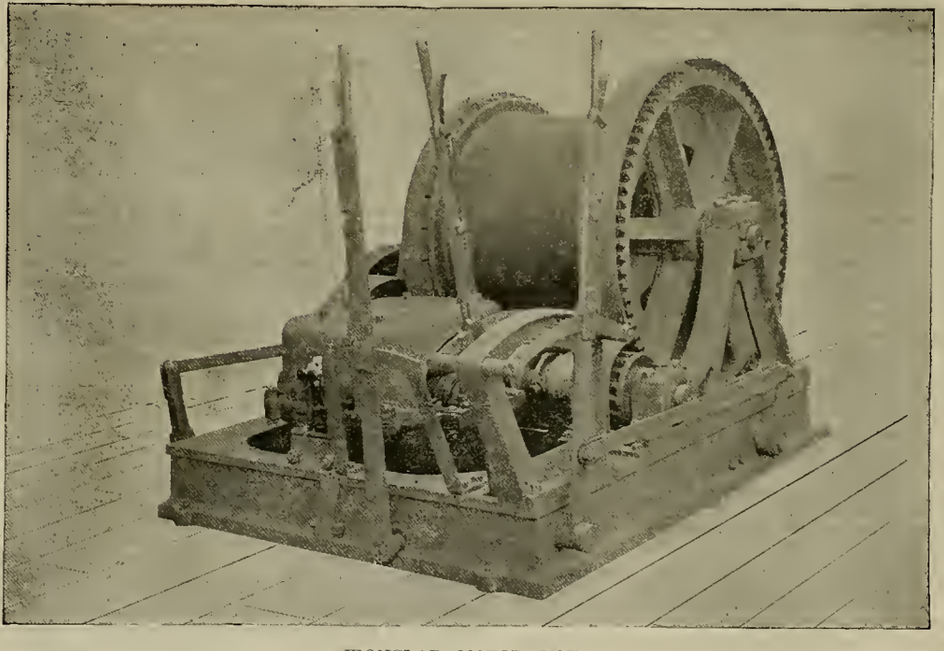
A test has recently been made of a new locomotive constructed to use erude petroleum as a fuel. The report says that the engine steamed very rapidly, and emitted little or no smoke. The locomotive was built at the Baldwin Works, in Philadelphia, under the direction of Superintendent Vauclain, who has had charge of the construction of the many "flyers" that have been turned out there. The test run was made between Baltimore and Philadelphia.

Ironclad Motor Hoists.

Herewith is illustrated an ironclad motor hoist, made by the General Electric Co., operated by motors of railway type, in which all moving parts are protected.

The motor is mounted on the same bed-plate as the hoist, to which all bearings, levers, quadrants and other conuections are attached.

The drum is provided with a band brake, lined with wood, and operated by a lever and quadrant. It is thrown in and out of gear by meaus of a friction clutch of the most positive and reliable type, which is operated by means of one of the levers and quadrants shown. The motor is controlled by a rheostat, to which one of the levers shown is attached.



IRONCLAD MOTOR HOIST.

It is said that Thomas A. Edison has already expended nearly $1,000,000 in his experiments to find a commercial method of reducing low-grade ores by electricity.

Uncle Sam's Big Magnet.

The most powerful magnet in the world, excepting those of Nature's own construction at the imaginary points of the earth known as the magnetic poles, says the Philadelphia *Inquirer*, is the invention of Colonel W. R. King, commander of the engineer corps of the army stationed at Willett's Point, L. I., and some very interesting experiments have been made with it. When Col. King conceived the idea of building an immense electro-magnet, he had no thought of its possibilities. There entered into the construction of the first magnet two huge guns, some pieces of iron, and a good many miles of heavy insulated telegraph wire. The guns stood on carriages on top of the fort. The pieces of iron were fastened across the breeches of the cannon, and were held in place by chains, forming a horseshoe. The telegraph wire was wound around the muzzle ends of the guns, making two immense spools. The current of electricity was supplied by a dynamo, and the first time the magnet was charged it developed marvelous power.

The work undertaken simply as an experiment soon became a matter of great importance. The magnet had not been long in existence when it was discovered that it would derange a vessel's compass at a distance of six miles from the fort. This discovery suggested that, if in time of war an enemy's ships attempted to pass the fort under cover of darkness or during the prevalence of a heavy fog, when the pilots would have to depend solely upon the ship's compass, the commanders of the war ships would probably find their vessels ashore near Willett's Point, where they could be blown up with torpedoes or destroyed by the guns of the fort.

Many experiments have been made from time to time in testing the power of the big magnet. One of the most interesting ever attempted was made under the personal supervision of Col. King. A number of pieces of railroad iron were placed near the muzzles of the guns and the current of electricity turned on. Immediately the rails flew to the magnet, and were held as fast as if they had been welded to its immense core. Col. King then had one end of a large chain fastened around the pieces of iron to ascertain the amount of power necessary to pull them away from the magnet. The other end of the chain was attached to a capstan that was held firmly in place by long stakes driven into the ground.

When everything was in readiness for the test the capstan bars were manned by eight stalwart engineers, and they endeavored to pull the railroad iron away from the magnetized guns. After straining for some time, the stakes holding the capstan in place gave way and it toppled over. The railroad iron had not even moved on the face of the magnet. The dynamometer, which had been attached to indicate the amount of strain the magnet would stand, showed that it had resisted 22,500 pounds. It was found impossible to disturb the pieces of railroad iron until the electricity had been shut off

Some time ago Col. King caused to be made the one-gun magnet. Thirteen miles of half-inch insulated telegraph cable was used in making the coil on the gun. Tests with this magnet showed that it possessed almost as much power as the first one, where two guns were used for the core. A number of exhibitions of the working of this electro-magnet was given before members of the American Society for the Advancement of Science. One of the exhibitions attracted a great deal of attention, as it best illustrated the power the magnet possessed.

The test consisted of four cannon balls being suspended from the muzzle of the gun. The balls weighed, on an average, 430 pounds each. The first one was placed under the muzzle of the gun, and, notwithstanding the smallness of the point of contact—made so by the shape of the suspended object—the ball was held very firmly. A second cannon ball was placed under the first one; then a third was put under the second, and when a fourth ball was held up by the magnetic attraction, exclamations of surprise came from the spectators. The smallness of the central point of bearing of each cannon ball, and the rigid manner in which the four iron spheres were held up, was considered to be the best exhibition of the magnet's power.

During a recent series of experiments, an iron tray, heaped up with old horseshoes, big iron spikes, nuts, bolts and other articles made of iron, was given to a soldier, and he was directed to hold the tray in front of him and walk toward the magnet. When the soldier arrived at a point about fifteen feet from the gun the contents of the tray departed with a rush and lodged on and about the muzzle of the big gun. The soldier had all he could do to keep the tray from following the scrap iron.

This test has suggested the possibilities of big electro-magnets being used to defend forts and earthworks from land attacks. A row of them of sufficient power would draw the smaller arms out of the hands of the infantry while the advancing column was still some distance from the place of attack, leaving the soldiers at the mercy of the garrison of the fort.

Combination Heater and Cook Stove.

Edward Miller & Co., New York, show a combination heater and cook stove—heater designed for oil, having a font with a capacity of four quarts, to burn twelve hours. The extreme height as a heater, with the drum, shown in Fig. 1 in position, is 30¼ inches and spread of feet 11¼ inches. The holder and drum are of Russia iron, with nickeled lamp and trimmings. For cooking, the drum is removed and the cast-iron extension top with three holes can be quickly placed in position. For roasting and baking, Nos. 2 and 3 ovens are furnished. The point is made that all the weight of the cylinders and utensils rests solidly on the font and not on the burner. Each lamp is supplied with an extra flame spreader for illuminating purposes when not used as a heater.

FIG. 1.—MILLER OIL HEATER AND COOKER.

FIG. 2.—SHEET IRON DRUM FOR HEATER.

ONE of the latest ways of obviating the trouble in soldering aluminum is to copper-plate the object first. Then ordinary solder will stick as it would to tin.

Increased Business.

The activity in mines means, of course, activity in the manufacture of mining machinery. Considerable has been reported in these columns of the manufacture and installment of several San Francisco made electrical plants. In this as in other lines of manufacture is to be noted the importance of San Francisco as an industrial center. Among larger operations is noted the building by the Fulton Engineering and Shipbuilding Works of a compressor plant for operating the new battery of pneumatic guns which are now being put in place for the United States Government at Fort Point, consisting of four boilers, two duplex compressors of six cylinders each, final pressure of air 2000 lbs. to the square inch. An electric light plant with all its accessories is a part of the contract.

The Fulton Engineering and Shipbuilding Works has a contract for four steam vessels and is engaged in extensive repairs on four Government vessels. They are also furnishing a thirty-ton concentrating plant to the Norman Mill and Mining Co., in the Ripsey mining district, ten miles from Riverside, Pinal Co., Arizona; a five-stamp mill to a mine at Yuma, Arizona; a ten-stamp mill to the Bay State mine, Plymouth, Amador Co., Cal.; a five-stamp mill to the Empire Mill and Mining Co., Copperopolis, and a 100 H. P. Corliss engine and vertical compressor to Wm. Johns, at the Whitlock mine, Mariposa Co., Cal. A duplex compressor has been sent to Supt. Oliver, at the Lockwood mine, Calaveras Co., and a single compressor to the Blazing Star mine, at West Point, besides considerable other mining machinery.

The Union Iron Works, which has been patiently awaiting Government delay on the Olympia, is at last in receipt of the armament which will allow the contractors to get that great war ship ready for service and enable them to again demonstrate that the largest and best work of that kind can be done in San Francisco. There are ten five-inch guns and four eight-inch guns, sent overland in charge of Lieut. Nicholson of the Washington navy yard. It is thought now that a month will complete the vessel. This great protected cruiser has twin screws, triple expansion engines and a ram; two broadside torpedo tubes on each side, a torpedo tube in the stem and another in the stern. The vessel's displacement is 5500 tons. The specifications required a speed of twenty knots an hour, but just a year ago in the Santa Barbara channel she speeded 21.67 knots an hour, for four hours. As there was a premium of $50,000 for every one-quarter knot over Government specifications, she earned her builders a bonus of $300,000, which has been paid. The specifications called for 13,500 H. P., but she developed 17,700 H. P. The Government gets a splendid vessel.

The Union Iron Works is also turning out some fine mining machinery. A twenty-stamp mill for the Baradove Mining Co. of Guanaxara, Mexico, a thirty-stamp mill for the Grand G. M. Co., at Idaho City, and a twenty-stamp mill for the Eagle Mountain Mining Co., Nevada county, are among recent shipments. Additional orders have been received from the company's City of Mexico agency.

The Risdon Iron and Locomotive Works have one of the largest contracts ever let in the State for ten Galloway engines for the Potrero Sugar Refinery. They are also furnishing large quantities of iron pipe, and are building a double cylinder 16x24 double-drum hoisting engine for a mine near Jackson, Amador Co., and a thirty-stamp mill complete for the Gold Blossom mine near Auburn. Recent shipments of the Johnston concentrator comprise five to Gibbonsville, Idaho, four to Salt Lake City and four to the Garcia mine, Mexico. A Bryan mill has also been sent to the latter named mine, one to Gibbonsville and one to the Bullion-Beck mine, Utah.

W. T. Garratt & Co. have just installed a fine pumping plant for Ryer, Eppinger & Thomas, near Rio Vista, consisting in part of a triple-expansion engine, 140 lbs. steam pressure, and two Scotch marine boilers, six feet diameter, eleven feet long. The capacity of the plant is 30,000 gallons per minute delivered eighteen feet high, through two hundred feet of thirty-six-inch pipe.

Pumping plants are being supplied by the Krogh Manufacturing Co. to the St. Chas. Hill mine at Downieville, the Throop mine near Stockton and the Jupiter G. M. Co. at Valley Springs. That company has also supplied a hoisting plant to the Rose Kimberly M. Co. at Shingle Springs.

The Pelton Water Wheel Co. is also busy, a dozen wheels having been lately sent out, including two to Petropolis, Brazil, each developing 300 H. P. under a 260-foot head. With this went 3000 feet of thirty-inch pipe.

Francis Smith & Co. have just completed a big job of making and placing twenty-two miles of iron pipe for the Oakland Water Co. from Alvarado to Oakland. From the wells to 23rd Ave. the pipe was thirty-inch; thence to Oak St., twenty-inch, the work being of more than ordinary magnitude.

Geo. E. Woodbury, who has removed to 143 First St., has sent several of his concentrators to points in Arizona, New Mexico and Colorado.

The Siemens-Halske Process for the Electric Precipitation of Gold from Cyanide Solutions.

By M. Eissler.

This process was in practical operation at the Worcester mine for several months, where I had the opportunity of examining it. At the Meyer and Charlton mine and at the Metropolitan the same will supersede the zinc precipitation method very shortly.

In 1887 Dr. Siemens, the eminent electrician of Berlin, found that the gold anode used in electro-plating at his works lost weight when standing in the cyanide liquor without any electric current passing through the bath. This fact, of course, hacked up the statements made by chemical authorities—that gold is soluble in cyanides, and induced him to try the use of cyanide solutions for the extraction of gold from ores.

He introduced the process in Europe, Asia and America, and during the year 1894 erected a plant capable of dealing with 3000 tons of tailings per month at Worcester mine, near Johanneshurg, Transvaal.

Why Dr. Siemens Adopted the Electrical Method.—He found that the zinc method as introduced hy MacArthur-Forrest only gave good results with strong solutions, while the electric precipitation was equally effective with either strong or weak solutions, and its efficiency was not lessened hy the presence of caustic soda.

The Action of the Electric Current on the Gold Solution.—The electric current decomposes a solution of metallic salt, the metal heing deposited on the negative pole, while the metalloid is liherated at the positive pole of the electrolytic cell. In a fixed time a given electric current will deposit a certain quantity of metal, which quantity varies for different metals in direct proportion to their electro-chemical equivalents. This law holds good only for solutions strong in metal; hut with very dilute solutions, as in use in the cyanide process, the current does not find sufficient of the metallic compound present at the electrodes, and consequently decomposition of the water also takes place. For this reason, to make the precipitatiou as great as possihle, constant diffusion of the solution is requisite.

In order, therefore, to create an artificial diffusion, a mechanical movement of the solution is important, and the most economical and convenient way of effecting this is to allow a slow hut steady flow through the precipitation boxes. But it is still more important to give a very large surface to the electrodes. In fact, a hetter effect is ohtained hy douhling the number of plates than by increasing the curreut tenfold.

CONDITIONS WHICH THE METAL CATHODE MUST FULFILL.

1. The precipitated gold must adhere to it.
2. It must be capahle of being rolled out into very thin sheets to avoid unnecessary expense.
3. It must he easy to recover the gold from it.
4. It must not he more electro-positive than the anode, in order to prevent return currents being generated when the depositing current is stopped.

The most suitable metal for the purpose is lead, rolled out in very thin sheets, which is therefore used in the Siemens-Halske process, and which meets all the requirements of the case.

The lead sheets are fastened in light wooden frames; there are three sheets of lead in each frame 2x3 feet, giving each frame a surface of eighteeu feet, and eighty-seven frames which are in each precipitating hox will expose a surface of 1566 square feet. Each frame holding three lead sheets at one pound weight each makes 261 pounds of lead in each hox.

The Anode.—No less important is the question of anodes. Iron anodes form Prussian hlue by the reaction hetween oxide of iron and ferro-cyanide. In consequeuce of this reaction, the amount of ferro-cyanide in the cyanide solution does not increase.

From the Prussian hlue the cyanide can he recovered hy dissolving it in caustic soda, then evaporating the solution, and finally smelting with potassium carhonate.

This last process has been carried out only on a small scale—about fifty pounds at a time—hut a nice, clean cyanide of potassium is ohtained. In the treatment of tailings this regeneration of cyanide is not of great importance, hut with concentrates, which decomposes the solution with formation of ferro-cyanide, it will effect a considerable economy.

ELECTRIC CURRENT REQUIRED FOR PRECIPITATION.

In order to precipitate the gold from cyanide solutions only a very weak current is required—that is to say, a density of ahout 0.06 ampere per square foot. With cathodes about one and one-half inches apart, seven volts is sufficient.

The advantages gained by using such a weak current are:

1. The gold is deposited hard on the plate.
2. The iron anodes are preserved for a long time, as their waste is in proportion to the current strength. In a plant treating 3000 tons per month, 1080 pounds of iron are destroyed in that period.
3. Little power is required. Seven hundred and forty-six Watts equal one-horse power. A 3000-ton plant requires 2400 Watts, equal theoretically to three and one-half horse power, and actually requiring ahout five indicated horse power.

ADVANTAGES OF ELECTRICAL PRECIPITATION.

The most important feature of electrical precipitation is that it operates on the solution quite independently of the amount of cyanide or caustic soda it contaius.

A solution containing 0.03 per cent of cyanide will dissolve gold just as effectively as a solution containing 3 per cent, provided a longer time is allowed for treatment.

It is my helief that the application of extreme weak solutions, such as are utilized in this process, will lead to important results in the treatment of the so-called rebellious ores, and that there is here a wide field open for investigation and research.

The vats hold 135 tons, and it takes five hours to fill them.

The tailings first get an alkaline wash of ten tons.

After this wash seventy tons of strong solution of 0.05 to 0.08 per cent is pumped on.

After this twenty tons of weak solution is pumped on of 0.01 per cent strength.

Total quantity of solution used 100 tons, and it takes five days to leach, filter and discharge each vat.

PRACTICAL WORKING RESULTS.

At the Worcester Works there are in use five leaching vats of twenty feet diameter with twelve-foot staves, each holding 3700 cuhic feet, 135 tons. One tank is discharged and filled every day. The strong solution used contains from 0.05 to 0.08 per cent cyanide, and the weak washes 0.01 per cent. The actual extraction of fine gold has averaged 70 per cent, while the consumption of cyanide has heen one-quarter pound per ton of tailings treated.

The precipitation plant consists of four hoxes twenty feet by eight feet wide and four feet deep. Copper wires are fixed along the top of the sides of the hoxes, and convey the curreut from the dynamo to the electrodes. The anodes are iron plates seven feet long, three feet wide, one-eighth inch thick. They stand on wooden strips placed on the hottom of the hox, and are kept in vertical position hy wooden strips fixed to its sides. In order to effect the circulation of the solution in passing through the box, some of the iron sheets rest right down on the bottom, while others are raised about one inch above the level of the solution, thus forming a series of compartments similar to those of a zinc precipitating box, the difference heing that the solution passes alternately up and down through successive compartments.

The sheets are covered with canvas to prevent short circuit. The lead sheets are stretched between two iron wires, fixed in a light wooden frame, which is then suspended hetween the iron plates. The hoxes are kept locked, heing opened once a month for the purpose of a "cleanup," which is carried out in the following manner: The frames carrying the lead cathodes are taken out one at a time. The lead is removed and replaced hy a fresh sheet, and the frame returned to the hox, the whole operation taking but a few minutes for each frame. By this means the ordinary working is not interrupted at all, and the cleaning out of the boxes, which is necessary in the zinc boxes, is only required at long intervals.

The lead, which contains from 2 to 12 per cent of gold, is then smelted into hars and cupelled.

The gold is deposited on the lead sheets as a thin hright yellow film which adheres firmly to the lead. The process of cupellation is too well known to need description.

The consumption of lead is 750 pounds per month, equal to 1¼d per ton of tailings. The working expenses are at the Worcester Works, treating 3000 tons per month, as follows:

	Monthly.	Per ton.
Filling and discharging leaching vats	£125	10d
Cyanide	75	6d
Lime	15	1.2d
Caustic soda	6	0.5d
Lead	14	1.1d
Iron	28	2.2d
White lahor	65	5.2d
Native wages and food	20	1.9d
Coal	57	4.6d
Stores and general charges	41	3.2d
Total	£450	or 3s

At a great many works, where correct sampling and assaying is carried out, the results—the gold won—agrees pretty closely with the assay results. At the Worcesters the following were the results for the month of August, 1894:

	Oz.	Dwt.	Gr.	
1350 tons tailings taken from settling vats containing	443	1	0	gold
1750 tons tailings taken from upper tailing dam containing	498	15	12	"
3100 tons tailings which, according to assay, contain	941	16	12	"
3100 tons residues which, according to assay, contain	239	7	12	"
Balance showing the theoretical output, or 74.6 per cent	702	9	0	
Actual gold won, or 74.1	697	15	15	

The tailings which were treated assayed from 6 to 8 dwts. The tailings or residues after treatment assayed from 1 to 2 dwts. The solutions which leave the precipitation hoxes still contain some gold, and the analysis in this case showed that the strong solution contained 4 dwts. 8 grains per tou of solution. The weak solution contained only 10 grains.

On an average in these works the strong solutions carry from 4 to 5 dwts., and the weak from 0 to 1 dwt.

In taking samples of the residues I would draw attention to the fact that the portion of the residues in which the largest proportion of unextracted gold is contained is near the hottom of the filter vat, say the last twelve to fifteen inches.

The hest way to sample is to take a sampling iron and probe every carload as it goes to the works, and do the same with every car as it leaves the works with the worked residues.

Miners' California Candlestick.

The accompanying cut is of a miner's candlestick as made hy the Cleveland, O., Lock Co. of hand-forged and wrought steel of enlarged gauge, with

MINERS' CALIFORNIA CANDLESTICK.

tempered points, but untempered stock, so in case they are dropped they don't break; also the hat hook is left soft, so it can he hent to suit tbe user. The candlestick spring socket is an especial feature, being light, strong, and can be sprung open hy pressing thumb knoh (on side) while holding in one hand and candle inserted with the other. This spring, as will be seen, has ornamented edges and made of finest spring stock. The hand bow is large and swagged into a half-round, just to suit the hand. They are made in two patterns, California (large bow hook, see cut) and Lake Superior (small double bend book). Plain hand forged, japanned, nickeled, and nickeled and engraved.

NEARLY 700,000,000 people carried ou American steamers during the last fiscal year and only 255 lives lost, of whom hut niuety-six were passengers, is the prominent feature of the new aunual report of Supervising Inspector General Dumont, of steam vessel inspection service. This, says the *Marine Journal*, is a smaller mortality among the same number of people, we have uo doubt, than if they had all stayed at home and went regularly to hed, to say nothing of traveling hy rail. It proves again what we have often remarked, that travel by American steamers, under the system of inspection now enforced, is the safest that could possibly be devised. Thirty-five of the ninety-six passengers above referred to lost their lives in one disaster, the sinking of the tugboat James D. Nicol off Sandy Hook on a Sunday in June last, and General Dumont states that this disaster was due solely to the fact that the tug was being navigated by a person wholly inexperienced.

That New Gold Saver.

We caution our miners not to place implicit confidence in the new gold process through which the owners claim they can secure more gold than a fire assay develops. A similar business was started in Denver about fourteen years ago. The pretended inventor went to a certain mine in which one millionaire was interested, made some tests, and informed the superintendent that he had discovered that two-thirds of the value of the ore had heen thrown away, the mill failing to reduce it and the fire assays failing to disclose it, and he wanted to sell his patent. The answer was: "Give me your formula. Let me work the ore for a month, and if such results as you claim are ohtained, the money will be paid you next day," and he offered to give a bond to cover the case. Tbe inventor declined and the invention fell through. It is easy enough to work a few pounds of ore aud to send the owner a return so magnificent as to cause his eyes to protrude. A five-dollar piece melted with the ore will do all that. But if a man is sincere, which we do not for a moment believe, hc will frankly say: "All right. I want so much for my process. Give me a contract tbat you will pay me that much, and I will turn over the formula through which you can do the work for a week or for a montb." When he refuses to do that it is fair to suppose there is a cheat iu the whole husiness; and the queer thing is tbat a cheat of this kind turns up once in about every fourteen years. One of the kind made a great sensation in Nevada ahout twenty-eight years ago. Another, as we said before, tried the same thing in Denver about fourteen years ago. Now we have a third one. By the way, we are not saying this last is not genuine. We are merely saying we believe it is an unmitigated fraud and would-be swindle.—Salt Lake Tribune.

Some of It Left Yet.

The actual amount of gold and silver that is used in a large plating establishment is very great, and the most strict economy is practiced in order that there sball be no waste. The extreme thiuness of the gold on cheap jewelry has long been a subject for jest by humorists. A party of Boston jewelers was being shown through one of the great plating factories hy the proprietor, a man well known as a wag. As the visitors stood looking into one of the vats where different articles were being plated witb gold hy means of a chemical process, a gentleman asked:

"Now, Uncle John, just how much gold do you use here in your business?"

The old man looked up and answered, with a twinkle in his eye: "Well, boys, I'll tell you. Wben I started iu fifteen years ago I put a $10 gold-piece into the vat, and I guess there's some left of it yet!"

A BILL is to be introduced in the next Congress to put the life-saving service on the same footing as the army in important respects. The hill provides for an increase iu the pay of the life-savers, for their retirement on half pay after a specified period of service or disability incurred in the service, and for a pension to the families of those who lose their lives in the discharge of their duty.

IN his annual report to the Secretary of the Treasury Superiutendent S. I. Kimball of the Life-Saving Service says that the number of disasters by reason of storms was greater than in any previous year since the introduction of the present system. The cost of the maintenance of tbe service during the year was a little more than $1,250,000.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XVI.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894, by Henry G. Hanks, F. G. S.

1856.—In this year a San Francisco company commenced working at the Brea ranch, near Los Angeles, and attempted to produce refined oil from crude asphalt; the results were not satisfactory. Particulars of their operations are not obtainable at the present time.

1857.—W. W. Jeukins, W. C. Wiley and Sanford Lyon began to prospect for oil in Pico canyon, Los Angeles county. Francisco Lopez, a former steward at the San Buenaventura Mission, informed them of the operations of Andreas Pico, and they found "tar" (maltha) oozing from the ground, both in Pico canyon and in Hooper, Sespe and Piru canyons in Ventura county.

1861.—In 1861 Mr. Charles Morrill was engaged in San Francisco in importing and selling paints, oils and drugs. His store was on the corner of Washington aud Battery streets. During that year he commenced distilling oil from the maltha-saturated sands of the Carpinteria beds, near Santa Barbara. He sent from San Francisco a large steam boiler, by the steamer Senator. There being then at Santa Barbara no wharf, the sailors resorted to the expedient of plugging up all the holes and floating it ashore.

The bluff at the seashore rises forty feet above the water. In this he found a stratum of coarse sand saturated with maltha, lying about eight feet below the surface, and horizontal or nearly so. This he quarried out and submitted to distillation in an iron still. His plant was somewhat extensive and the product fairly good. The enterprise was not, however, a success, although the reason is not known. It is certain that it was a financial failure. In May, 1893, thirty-two years after, I saw the remains of his apparatus lying on the beach, which had been piped out from under the drifted sands, where it had lain since his works were abandoned.

1864.—No further special interest was taken in petroleum until 1864, when, in September, Professor B. Sillimau Jr. made a report to the California Petroleum Company, owning the Ojai ranch in Ventura county. All that part bearing on the oil and asphalt deposits of the State is here quoted:

"About ten miles nearly north of the old town of Buenaventura is a mountainous ridge, rising about 2000 feet in height and continuing for about thirteen miles. This mountain has the line of its crest running nearly east and west, aud it is bounded on the west by the valley of Buenaventura and San Antonio creek, while to the east it is cut off by the Arroyo de Mupu. Several smaller streams or dry canadas divide both slopes of this mountain into subordinate districts; but, viewed as a whole, the entire range from east to west is one great fountain of mineral oil or naphtha, oozing through the outcrop in oil wells which, losing the more volatile portion by evaporation, give origin to extensive deposits of asphaltum or mineral pitch, through which at numerous points the oil still penetrates and in the fervid sun of the region soon escapes by evaporation."

The Coast Range retires from the shore a few miles north of Buenaventura and leaves an open plain next the sea, widening in the direction of Los Angeles county, and offering for agriculture some of the best savannah lands on the coast. The oil range forms the boundary of this plain on the left hand, or toward the north, its ridge as already stated hearing almost east and west. The eye of the observer is at once arrested by its regular stratification, the line of its bedding appearing in the same horizontal plane across the furrows and intermediate valleys of the range.

These beds are seen to dip at a high angle to the north, measuring from seventy to eighty degrees from the horizontal, preserving a remarkable uniformity throughout the entire range. The rocks forming the oil series are generally thin bedded, easily split, and usually present on their up-turned edges no index of their true nature, since the most highly bituminized shales are weathered white at the outcrop, while others are turned red by the oxidation of the iron which exists in them as protoxide, carbonate weathering red or yellow, while others are yellowish from free sulphur or the yellowish sulphate of iron and other saline substances. Some of the beds of sandstone are buff-colored and form distinctly marked lines of a harder composition. The hammer soon reveals the true nature of the beds, the bituminous shales breaking black like coal shales, and shining with the lustrous varnish of asphalt. Thin beds of calcareous schists also exist, likewise bituminous and weathering whitish.

No fossils were detected in any part of this range beyond a few obscure impressions of plants without definite character, and yet seemingly reed-like. That the beds are cretaceous or Tertiary is pretty certain from evidence found in other parts of the Coast Range. It appears from researches of others that this zone or range of bituminous shales extends at intervals for 150 miles south of this. I have traced it as far as the Canada de la Brea in Los Angeles county, while it extends also at intervals to the north as far as Gilroy, in Santa Clara county, or about eighty miles from San Francisco.

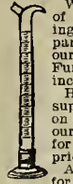
In most of these cases the outcrops are too distant from the sea for advantageous working; nor do exudations of oil appear so encouraging in most other points, as in the Buenaventura district.

These facts are chiefly interesting, as they serve to show the streugth and persistence with which the rocks of this range were originally charged with the organic matter, whose transformation has produced petroleum. It is to be observed in this connection that the transformation of woody fiber into oil is a chemical change, takiug place always out of contact with the air and usually under water, but by no means necessarily connected with any particular geological period.

(To be Continued.)

Selby Smelting and Lead Company,
416 Montgomery Street, San Francisco.
Gold and Silver Refinery
—AND—
Assay Office.
HIGHEST PRICES PAID FOR GOLD, SILVER AND LEAD ORES AND SULPHURETS.
Manufacturers of
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, ETC., ETC.
Also Manufacturers of
STANDARD SHOT-GUN CARTRIDGES,
Under Chamberlin Patent.

John Taylor & Co.
Importers and Dealers in
Assayers' Materials,
Mine and Mill Supplies.
Also Chemicals, and Physical, School and Chemical Apparatus.
63 & 65 First St., Cor. Mission, San Francisco.



We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.
Agents of the Denver Fire Clay Co. and for the Morgan Crucible Co., Battersea, England. Also for E. G. Denniston's Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our Illustrated Catalogue and Assay Tables sent free on application.
JOHN TAYLOR & CO.

The Ideal Steam Oil Refiner
FOR STEAM POWER PLANTS.
The Purity Oil Filter
FOR WATER POWER PLANTS.
Will reclaim your waste oil and make it equal and often better than new oil. Will reduce your oil bills 50 per cent and save your bearings. In use with the largest and best plants everywhere.

FRANCIS SMITH & CO.,
—MANUFACTURERS OF—
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes,
130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with a composition of Coal Tar and Asphaltum.

Scientific Progress.

Tesla's Oscillator.

Tesla's latest invention, the "oscillator," is one of the most remarkable appliances of the age. It is described as being the core of a steam engine and the core of a dynamo combined, making a harmonious mechanical adjustment. This combination, says an enthusiastic admirer, constitutes a machine which has in it the potentiality of reducing to the rank of old bell metal half the machinery at present moving on the face of the globe. It may come to do the entire work of the engines of an ocean steamship within a small space they occupy and at a fraction of their cost, both of construction and operation. It will do this work without jar or pounding, and will reduce to a minimum the risk of derangement or breakage. There is nothing in the whole range of mechanical construction, from railway locomotives to stamp mills, which such an invention may not revolutionize. The essential characteristic of the machine is the application of the pressure of steam to produce an extremely rapid vibration of a bar of steel or piston, which, in turn, is so adapted to a set of magnets that the mechanical energy of the vibration is converted into electricity. The extraordinary result is that practically an absolutely constant vibration is established, and a power is obtained greatly beyond that obtainable in the most costly expansion engines using a similar amount of steam.

Besides saving in mechanical friction the 35 per cent of loss in the working of the engine, the 15 per cent of loss in belt friction, and the 10 per cent of loss wasted in the dynamo, making altogether an addition of 60 per cent to the available energy obtained from the steam for the purpose of producing electricity, it is simpler, lighter and smaller than the mechanism it is designed to replace, absolutely constant in its action, automatically regulated, and subject to the least possible amount of wear and tear. The utilization of this machine in any branch of industry would result in an appreciable lowering in the cost of production, and it is quite possible that its first general employment may be in electric lighting.

In the face of this marvelous invention a recent statement of Tesla seems hardly longer visionary. The young Montenegrin said: "I expect to live to be able to see a machine in the middle of this room and move it by no other agency than the energy of the medium in motion around us."

THOSE who discuss the history of accumulators find that there is practically no difference between a storage and a primary battery. The amount of energy that one pound of lead will generate, if wholly converted into lead sulphate, could be produced by about one-quarter of a pound of zinc or iron, or about half a pound of copper. Practically the very property of lead which at present constitutes its superiority to other metals—that is, the insolubility of its sulphate—at the same time limits its efficiency by reducing the energy obtainable at a small fraction of the theoretically possible amount. The active material requires a grid, and under the best conditions not more than half of the active material is really acted upon, the result being that not more than five to fifteen per cent of the total weight of electrodes is usefully employed.

AN effective and simple device has been patented for starting electric motors without the risk of burning up the armature coils at the moment of switching into circuit. This consists of a series solenoidal magnet coupled in circuit between the generator and the motor, the one end of the coil being joined to the core, which carries an arc lamp carbon. A lower carbon is connected to the outgoing lead, and when current is first switched on an arc is struck between the carbons. As the motor gets up speed the arc shortens, and when the current has fallen to its permanent value the carbons come together, as the lifting power of the solenoid is theu diminished below what is necessary to maintain an arc. This arrangement, if left in circuit, would also act as a safety cut-out in case of a short circuit or sudden load coming on the motor, checking its speed and greatly reducing its back E. M. F.

The Amount of Moisture in Steam.

A method of testing the amount of moisture in steam has been discussed by the Institution of Engineers and Shipbuilders, Scotland. The principle in this case, more particularly applicable to marine engines, consists in comparing the saltness of the steam with that of the water in the boiler. The test, as explained, is carried out by means of nitrate of silver, and the reaction is so delicate that, with only one per cent of salt in the boiler, one per cent of priming water can be accurately determined to the second decimal. To one part of salt boiler water there is added 100 parts of pure condensed water, and into this is poured a small quantity of concentrated solution of yellow chromate of potash; then a nitrate of silver solution containing about one-tenth per cent of this salt is slowly added. With each drop the salt water turns locally orange red, but this color disappears at first. Later on, when all the salt has been acted on, the whole fluid changes color from pale yellow to orange. The quantity of nitrate solution is noted, and then the experiment is repeated on the condensed steam from the engine undiluted with distilled water. The ratio of the quantities of nitrate of silver solution used in the two tests expresses the amount of priming in per cent.

Mining Stream Tin.

Stream tin, which is found in the Widdecome valley, in South Devon, England, is so called because it lies in long lines as if deposited by water and is the richest as well as the easiest to be found. At the vastly remote period when the granite was upheaved, and currents of water poured over its surface, sweeping away the overlying fractured beds, and then abrading its own surface, a great deal of its upper crust was washed away. Now, granite contains in it veins of tin These veins are not in themselves very rich, but when the water chumped up the granite it carried away the feldspar and quartz in a milky flood and threw down the heavy tin; the decomposed feldspar it also cast down, but far away in basins and lakes where were natural reservoirs. These were in time filled to the brim with the white feldspar, and they are now worked for china clay. This deposit is white as chalk, and the water that runs away with some of it in solution is like milk, and has a slightly sweet taste.

An Object Lesson.

A mining company yesterday shipped from this city to Latrobe for Oleta twenty tons of mining water pipe. From Latrobe to Oleta it is twenty miles. The charge for hauling the pipe that distance by team is $7 a ton, and teams were ordered to Latrobe yesterday to haul the pipe to Oleta to-day at $7.

Last night a telegram came to the directors of the mine in this city, saying that because of the effect of the heavy rains on the bad wagon roads the charge for hauling the pipe must be raised to $12 a ton, and the directors, recognizing the justice of the charge, acceded to the raise, and the pipe will be started from Latrobe to-day.

The extra cost for this single lot because of bad roads is thus seen to be $100. If the road from Latrobe to Oleta was even a half "good road"—and Amador county is rich in good road material—the charge per ton for hauling would not exceed $3 or $4 a ton, and in the worst weather not more than $5. So to a single firm of Amador miners the assessment on one lot of goods for bad roads is not less than $140. Does it pay to maintain bad roads?—Sacramento Union, Dec. 14th.

FRANK T. SUTHERLAND, M'g'r Pacific Coast Agency

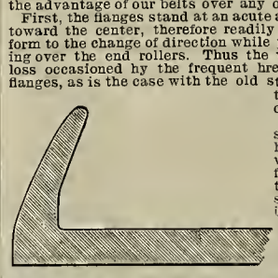
Office and Warerooms: 9 FREMONT St., San Francisco, Cal.

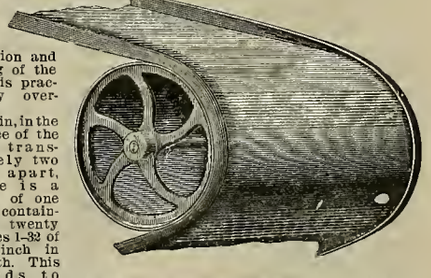
Or, Address the Company at its Denver Office.

Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.

Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.





Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty rifles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from hanking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

H. G. BLASDEL, JR., Manager,

419 California Street, Haywards Building.....San Francisco.

Mechanical Progress.

Heat Units and H. P. of Boiler.

By W. D. Browning, M. E.

A few days before the creation of Adam and Eve, heat came into existence. The days may have been thousands and thousands of years, we do not know, but that heat existed is evident from the fact that it is not all subdued at the present time.

That it was necessary to the formation of the earth and is a very desirable thing at present is also evident, yet it may be said that its true nature was not thoroughly understood until ages had passed since Adam's time. In fact not till the subtile mind of Sir Humphry Davie conceived that heat was not a material substance but "that the immediate cause of the phenomenon of heat was motion."

Still we know that things may be hot without being visibly in motion; hence, if heat is motion, the motion must exist in parts of the body too minute to be seen. These parts or molecules are held together by mutual attraction or cohesion and are in a continual state of agitation. The hotter the body gets the more vigorous the agitation until, with solids, the limit is reached, then on the addition of more heat the molecular attraction is overcome and the solid becomes a liquid. On still continuing the heat, further separation of molecules takes place, attraction is overcome and they fly off in all directions, the liquid becoming a gas. This we see in the action of some coals in the furnace. By the heat of more volatile matter the coal is heated, becomes pasty and part of it passes to a gas.

The transfer of heat from one body to another may take place in any of the following ways: namely, by radiation, conduction or convection. The heat from the burning coal is transferred to the crown and sides of the furnace by radiation, passes through the plates by conduction and the water is heated by convection. The process by which heat passes from hotter to colder parts of the same body is called conduction, and converted or "carried heat" is that which is transmitted from one place to another by currents.

Before quantities of heat can be measured we must have a "unit of heat," called a British thermal unit, which has been defined as "the amount of heat necessary to raise the temperature of water one degree Fahrenheit." Then for water at boiling temperature, under atmospheric pressure, the "sensible" heat=212°−32°=180°, or 180 units of heat would be necessary to raise one pound of water from 32° to 212°.

The "latent heat of steam" is defined as the amount of heat required to convert one pound of water, at a certain temperature, into steam at that temperature, and the "total heat of evaporation" is the sum of the "sensible" and "latent" heats and is defined as the heat required to raise one pound of water from 32° to the temperature of evaporation, and convert it into steam at that temperature.

The British thermal unit, liberated by the combustion of a given quantity of coal is mainly dependent upon its initial and final temperatures and densities of the confining elements.

The heat available for generation of steam depends upon the means taken to prevent the heat from being otherwise abstracted, and the only ways whereby it can be lost are by radiation into the atmosphere, from the furnace, and by the waste gases.

Furnace radiation may be reduced to a minimum but the temperature of the waste gases can never fall below that of the steam they are generating.

The heat utilized depends upon the temperature of the waste gases, when they pass from contact with the boiler, which should never exceed 600° to 550° Fahr. above that at which they enter the furnace. For example, the heat derived from a pound of good coal is about 14,500 B. T. U. (British thermal unit) and the waste gases at 550° carry off about 2850 B. T. U., so that there are but 11,650 units for steam generation and these may be much reduced before getting to the water.

Instead of dealing with an uncertain degree of heat, as is liable to be given off by the coal, because coals differ greatly, we might turn to the water side of the plates and work the units from tables on saturated steam.

The B. T. U. imparted to one pound of water in a boiler would be found opposite the pressure of steam, under consideration and under the head of "total heat," that is, the total heat from 32° Fahr. and at absolute pressure. (See D. K. Clark's Manual.) Suppose the total heat be wanted for one pound at 80 pounds, by gauge (95 abs.), feed 50° Fahr.

The total heat, from 32° to steam at 95 abs., would be 1180.3, and deducting the heat of the liquid at 50° (50−32=18), we would have 1162.3 B. T. U. necessary to raise one pound of water from 50° to steam at 80 pounds pressure.

As the temperature of the feed-water and the pressure of steam varies in different tests of boilers, and in order to compare the evaporation of one with another we must assume some standard.

This standard is given, called a "commercial H. P.," as the evaporation of 30 pounds of water per hour from a feed of 100° Fahr. to steam at 70 pounds pressure by gauge, and the total heat in one pound, according to above conditions, is also "rated" as 1102.5 B. T. U.

Then, knowing the number of pounds of water evaporated per hour during the test, the B. T. U. per hour may be found. The B. T. U. per hour divided by 30×1102.5 will give the H. P. of the boiler, on the commercial rating. Suppose the water evaporated per hour is 2400 pounds, then $\frac{1162.3\times2400}{30\times1102.5}=84$ H.P.

Of course, it must not be assumed that one H. P. in the boiler gives one in the engine.

Electricity for Tool Driving.

In a recent discussion of the question of substituting electric motors for shafting, this view was advanced: "Isn't it going to be cheaper to string a copper wire to a tool, have a small motor built with it, and drive by electricity, than it is to turn a long line of shafting several hundred feet in length, and keep it revolving day in and day out, whether there is any work being done at the other end of it or not? Some large shops have answered 'Yes;' but the art is still in an experimental stage, and no one really knows. It seems reasonable, and I am rather disposed to believe it. But whether the electrical breakdowns of the motor will more than counterbalance the mechanical breakdowns of shafting and belts remains to be seen."

GREAT accuracy has become an important factor in almost every kind of workmanship, and some mechanics are very expert in finishing work to the exact size called for by the drawings. Not long ago, in a Philadelphia machine shop, the head man was speaking of a device consisting of a short steel rod fitting into a hollow cylinder, the rod being three-quarters of an inch in diameter. The fit was so perfect that it would slide freely in and out, but it was found that if the rod were taken out and held in the hand for a few seconds, the slight expansion caused by the warmth of the hand was enough to make it impossible to insert the rod until it had been allowed by gradual cooling to regain its normal size.

THE coming additions to the navy yard at Washington will place its gun-making plant in the front rank of the world's ordnance factories. Two slotting machines for the very heaviest work will be added, also four horizontal boring and drilling machines to bore to the center of a sixty-nine-inch circle, a twelve-foot boring and turning mill, electric traveling cranes of the newest patterns and with supports and runways weighing 228,000 pounds. Besides these there will be four planing machines, 14x18 feet long and four and eight feet high and wide. Portable drills and special machinery of all varieties will be a part of the new equipment.

Practical Treatise on Hydraulic Mining.
BY AUG. J. BOWIE, JR.
This new and important book is on the use and construction of flitches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid For sale by THE MINING AND SCIENTIFIC PRESS 220 Market St., San Francisco.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WHEELER PLACER.—*Republican:* Dr. Read of Amador City has organized a company to purchase the Wheeler placer claim at Pine Grove, for $25,000. Two thousand dollars has been paid, the balance to be paid in installments. The claim has every indication of being a rich one. Pans of dirt taken from all parts of the claim yield excellent prospects. An impounding dam is being constructed, and active mining by the hydraulic system will be inaugurated early next year.

A. Harpending has bonded the Kroning, near Plymouth, for $20,000, and the mining claim of S. H. Phillips on Indian creek, for one year.

THE SOUTH EUREKA—SUTTER DISTRICT.—*Record:* At the South Eureka over sixteen hundred feet of drifts and crosscuts have been run on the 900 level. During this prospecting a solid chimney of ore of more than 300 feet in length ranging from three to eleven feet in width, has been encountered, much of it being of a very high grade, running up into high value per ton. In addition to this an upraise was made of 120 feet, and the same grade of ore was found to the very top of the upraise. On the 500 level much prospecting was done. The ledge encountered was very large and extensive, but was of low grade, ranging from $2 to $7 per ton; but even with this showing, Supt. Parks of the Kennedy told the writer, more than a year since, that if the same grade of ore continued another five hundred feet, it would warrant the putting up of a sixty or eighty stamp mill. It seems, however, from present developments, that the ore body, as greater depth is attained, has steadily increased in richness and not decreased in size. No mine ever opened up on the mother lode in Amador county has made the showing at the same depth that the South Eureka now does. Even the famous Kennedy, located farther to the south, encountered no permauent paying ore body until the 1,100 level was reached. Another three hundred feet is now being sunk, which will bring the incline down to the 1,200 level. Preparations are now being made for the erection of a great milling plant on the property early in the coming spring.

Kern.

Californian: In the Rodgers mine at Agua Caliente, a ledge three feet wide has been struck which mills 2700 ounces of silver and $200 in gold to the ton. Twenty-six sacks—about 2500 pounds—sent to San Francisco, cleaned up $1800 in silver and gold.

Mono.

WORK AT THE STANDARD.—Bodie *Miner*: The cyanide plant has been closed down for the winter, as the tailings are frozen so they can no longer be handled to advantage. There was also difficulty in regard to the supply of water which, since the burning of the Standard Company's hoisting and pumping plant, has been quite scanty; and the building being this, the water in the tanks and pipes gave difficulty on account of freezing. The plant has been very successful and will re-open in the spring as soon as the weather permits.

The *Miner* is authorized by the Supt. to state, in contradiction of a recent statement in the Virginia papers, that the output for two months was about $16,000. At Green Creek the foundation and the piling of the dam is all in, and both water pipe and sluice pipe are in place. If the weather holds good for two weeks more the dam will be in perfectly safe condition for the rest of the winter. The dam is a crib dam, rock filled; and has been built up about six feet. An additional force of twenty men recently came in from Carson, and other points along the road, and the large force now at work will push the work to a speedy completion. The break in the company's ditch, which has compelled a temporary suspension of work at the mill for want of power, fortunately occurred below the dam. The mill is now accumulating a stock of ore and will resume operations in a day or two. The company has paid out during the month of November the sum of $28,300, the larger part of which was on the pay roll.

Plumas.

NEW MINING ENTERPRISE—*National-Bulletin*: Gullic & Co. have opened up the tunnels on the old Pennsylvauia quartz mine, now called the Hibernia, south of Greenville. This property was prospected in a crude manner, twenty-eight years ago, then paying $5.50 per ton. In those days, considering the crude and expensive methods employed in working ores, such returns were considered too small to attract much attention. Working of the property ceased, and it passed into the hands of the late Henry O'Toole, who afterwards received a government patent to the mine under the name of the "Hibernia." Mr. O'Toole had many offers for the property, but would not sell, hoping to be able to work it himself. Adverse circumstances and ill health prevented him from so doing. Just before his death, about two years ago, he deeded the mine to his brother James, who nearly a year since bonded it to Gullic & Co., and they have opened up the property in four different tunnels and places, showing ore veins aggregating twelve feet in width. They made a thorough test in a stamp mill, the ore yielding $5.90 per ton. It is all free milling.

Gullic & Co. have taken the property and made agreed payments. Last week over twenty men were employed in building roads and doing other necessary work. Being satisfied that the mine will pay a good profit, the new owners, during the winter, will open it properly, and next spring build a twenty-stamp mill buying the latest and best machinery.

Riverside.

PINACATE MINING DISTRICT.—At the Alice there is a fifty-foot vertical shaft and seventy-foot incline in a good body of ore, with considerable upon the dump. Preparations are being made to put up a mill. Twenty dollar ore has been taken from the Briggs mine, about fifteen miles from Perris, in a southeasterly direction.

At the Mouifee several shafts have been sunk, and considerable $20 ore run through the five-stamp mill. But with the ore being crushed as fine as it is, but little is run each day.

At the Missing Link the necessary hoisting and pumping machinery has been put in and the shaft is down 200 feet. The ore taken from this has averaged $18 a ton.

The Golden Chariot is a promising mine on on the same vein with the Santa Rosa. The Santa Rosa iu a comparatively old mine, having been worked by Mexicans with arrastras. There is now a ten-stamp mill there, with power for twice this number of stamps. At the bottom of the 200-foot level a drift has been run south for 300 feet, all good ore. The machinery and equipment is excellent, and is owned by the same men having the Good Hope. It is eight miles from Perris, which is thoroughly modern in all its appointments. It is being worked most at the 430-foot level, though at 530 feet there is being opened a drift through good ore. All the rock taken out is rich enough to pay for working. At the 430-foot level the vein bas been explored for a long distance, without any indications of a termination. It is estimated that the present product is about $30,000 a month, hut as there is some ten tbousand tons of ore in sight, and is expected to double the mill capacity, the output will be greatly increased. This mine has been worked for about fifteen years, Mexicans locating it and working it with arrastras.

At the Santa Fe, another old mine, first worked by Mexicans with arrastras, the five-stamp mill from the Temescal tin mine has recently been set up, and is crushing fine ore. The owners believe that they have a bonanza in the mine. The great beauty of tbis mining district is tbat it is located in the midst of good farming lands and near the railroad, with plenty of water, wood and coal easily obtainable.

Siskiyou.

MINING NOTES.—*Journal:* Several claims have been located lately in Cottonwood district on the quartz ledge known as the porphyry dyke. which extends a long distance and prospects very rich. Throughout the entire limit of the Cottonwood district, many quartz and placer locations have been made, and also in the adjoining Hungry Creek, Ashe Creek, Fool's Paradise, and other mining camps along the Klamath river, at the base of the Siskiyou mountain foothills.

As soon as the cool weather now prevailing moderates, to start the snow melting, there will be an abundance of water in all the small streams and ditches to commence work in hydraulicking, ground sluicing and sluicing, to wash up piles of pay gravel accumulated during the dry summer and fall months. besides uncovering vast beds of pay gravel under the high banks along the various gulches, ravines and streams. The winter so far has been good for mining, by the piling up of considerable snow on the mountain summits to dissolve duriug the warm days of winter, spring and summer.

Trinity.

THE UNDERGROUND TREASURE MINE.—*Journal:* P. Holland of Trinity Center was in town Thursday and brought with him a portion of his last clean-up from the Underground Treasure mine on Coffee creek. It was as pretty gold as one would wish to see. He had it in two parcels, one, which he calls fine gold, consisted of pieces about the size of a finger nail; the other of nuggets weighing from one half to two ounces. It makes the man looking at it thiuk he is in a miuing county.

Mr. Holland's mine is situated on the East Fork of Coffee creek ahout four miles from its junction with the main creek. He owns about three miles of the bed of the creek, which he has been working since 1877. principally drifting till last seasou, when he opened his mine on a more extensive scale. He has constructed a reservoir with a dam seventy-five feet long, thirty feet wide at the bottom and twenty feet at the top and sixteen feet deep. The gate is a self-shooter twelve by fourteen feet and discharges about 31,000 inches of water for ahout five minutes. This immense body of water rushes down the creek with great velocity, throwiug big boulders iu all directions. He has a large derrick on the mine worked by an overshot water wheel.

The gold is coarse and easily saved. It is a valuable property and, in the hands of capitalists who would work it on a large scale, would add materially to the gold output of the county.

NEVADA.

The *Silver State* says a rich strike has been made in the Coyote mine, Kenuedy district, lately purchased by C. A. Norcross, an average taken from the pay streak assaying $261 in gold per ton.

KENNEDY MILL AND MINES.—*Reveille:* At Kennedy the miners employed by the Imperial Company have accepted sixty-five cents on the dollar for fifteen days' work; the mill men have refused to settle only on the basis of dollar for dollar, and the company has shut everythiug down. The superinteudent is in Winnemucca.

ESMERALDA COUNTY.—This district is seven miles south of Soda Springs in Esmeralda county, at an altitude of 7,000 feet. Wood is plentiful; two springs supply the camp with water, also the five-stamp mill of the Douglas Miuing Company.

In the last fourteen months 125 mining locations have been made, several of which have been developed into paying mines. One of these is the Hardscrabble, which recently cleaned up $10,000 in gold from 125 tons of ore, and there is enough such ore in sight to keep the mill running for a year. The Orphan Boy ore works $30 per ton; the New Party ore $45 per ton; the Julia $25 per ton; the Snowball $25 per ton; the Fortuna $25 per ton; the Hardluck $30 per ton, and the Oneida ore is reported to be worth $200 per ton. The ores of the district are free milling and $10 ore has been worked at a profit. So far 400 tons of ore have been worked and the bullion produced and shipped was worth $16,000. The Douglas Company is making arrangements to run the mill day and night as well as all the mines above named are bringing in ore.

At present there are seventy-five men in camp, many of whom are working on leased mines. There are many ledges, the most prominent of which can be traced five miles by croppings.

FORMATION OF SILVER MINES.—*Silver State:* The process by which nature forms her silver mines is very interesting. It must be remembered that the earth's crust is full of water, which percolates everywhere through the rocks, making solutions of the elements obtained from them. These chemical solutions take up small particles of the precious metal, which they find here and there. Sometimes the solutions in question are hot, the water having got so far down as to be set boiling by the internal heat of the globe. Then they rush upward, picking up the bits of metal as they go. Naturally, heat assists the performance of this operation. Now and then the streams thus formed, perpetually flowing hither and thither below the ground, pass through cracks or cavities in the rocks, where they deposit their loads of silver. This is kept up for a great length of time—perhaps thousands of years—until the fissure or pocket is filled up. Crannies permeating the stony mass in every direction may become filled with the precious metal, or occasionally a chamber may be stored full of it, as if a million hands were fetching the treasure from all sides and hiding away a future mine for some lucky prospector to discover in another age.

STOREY CO.—In the Savage, on the 1000 level, in the north lateral drift from the east drift, they continue to extract ore from the sill floor up to the eighth floor. The east crosscut started from the face of the south drift was advanced 50 feet and connected with the east ore stope from the 1100 level. The north drift from the station is advanced 25 feet; face in clay and porphyry. On the 1050 level, in the south drift started from the east drift 30 feet from the south ore stopes, they continue to extract ore of fair grade. They have sunk a winze in this ore 14 feet, all in ore of fair grade. This winze is being sunk to connect with a south drift from the sixth floor, which is now advanced 25 feet. At a point 25 feet back from the face of the south drift they have started an east crosscut and advanced same 10 feet; face is in quartz showing spots of ore. During the week they have hoisted 133 cars of ore. Shipped to the Nevada mill 135 tons and milled 125 tons. Car samples average $27.50 per ton. Battery samples average $20 per ton. Bullion yield for the week, $1582.50. Shipped to United States Mint at Carson, December 17th, 150 pounds of bullion of an assay value of $3427.57.

ALASKA.

John Healy, of Juneau, Alaska, recently visited Montana friends, says the *New Northwest*. He was a former resident of this State, but for the past few years has been an Alaskan, interested in business at Juneau and in navigation and trading on the Yukon, with posts at Fort Cudahy and Selkirk, 1,600 and 1,850 miles respectively from the mouth of the great northern river. One of the company's boats, of 400 tons burden, plies the waters of the Yukon to the head of navigation, Selkirk. The country about Fort Cudahy is a placer mining region, the diggings being on small tributary streams of the Yukon. As high as 1,100 ounces of gold has been washed from the auriferous ground in a single week's run. One hundred dollars to the man per day has been more commonly realized, and ounce diggings is more frequently averaged. The winters are rugged—colder at times than experienced in Montana. The most serious drawback to mining operations is the shortness of the season adapted to that kind of work. Mr. Healy carries in his pocket specimen nuggets not unlike many dug from Montana placers. The largest nugget of which he has knowledge, washed from the Alaskan diggings, was of the value of $504. Of course, Yukon navigation is closed ahout half the year.

ARIZONA.

Two concentrators have been added to the Crowned King mill, making eight in all, now in. New plates have also been put in the mill and the machinery has been put in thorough repair, and everything is now in readiness for starting except water. When water supply is obtained the mill will he started and kept in operation as long as the water lasts. New ore bodies have been opened up in the mine, and the property is said to he looking better than ever in its history.

The Goodenough mine in Santa Maria district, continues to improve. Mr. Thorne says that preparations are being made to start work again on the Austin group. A number of prospectors and miners are at work in the district on claims of their own, and are meeting with good success. Arrastras are being used for the reduction of the ore taken out by them.

The rest of the machinery required for the Bucyrus steam dredge and amalgamator of the Lynx Creek Hydraulic Company has been placed in position, and the big machine is at work again tearing down the rich gravel beds and separating the gold.

J. W. Wentworth, of Payson says: The Zulu property, in Tonto Basin, has loomed up as a mine of the first magnitude. It's a peculiar mine. On the surface, it was simply an aggregation of stringers, low grade and sulphuretic. But the owner, Samuel Hill, of Prescott, felt assured that something of value lay beneath, so pushed the work downward. He was justified in his faith, for now, at 200 feet depth, they have a compact ore body seven feet wide, averaging $40 to the ton. And the curious part is that the ore is all clear quartz, absolutely free milling, not a trace of baseness being noted. There is a seven stamp mill on the property.

ON THE AGUA FRIA.—Prescott *Courier:* W. L. Roberts, who built the five stamp quartz mill on the Agua Fria, has met with such marked success that he has increased the capacity of the mill to ten stamps and changed his eight-foot wheel to a ten-foot wheel. He has water power enough to run a sixty-stamp mill.

O. B. Marshall and J. C. McDonald leave to-day for their Mammoth mine, Copper Mountain district, with a wagon load of mining tools and supplies preparatory to a long siege of development work. This ledge is sixty feet wide and samples $16.36 per ton across the ledge. The ore is free milling. Near by is plenty of timber and the Agua Fria river with water enough to run a large mill by water power.

MEXICO.

MEXICAN TIN MINES.—The Pittsburg and Mexican Tin Mining company of Durango, Mexico, has increased its machinery equipment for the treatment of ore from its mines, which it is said yields an average of four per cent pure metallic tin and is found in unlimited quantities. On June 9th the production was said to be about fifteen tons of metallic tin a month, hut work was suspended until October owing to the building of additions to the plant. The present capacity of the works is sixty-four tons of ore per day, which means a production of about three tons of metallic tin. This will soon be increased to eighty tons per day. The company has in all six prospects and three mines. The prospects have been tested to a depth of from twenty to fifty feet and the mines from 150 to 300 feet.

MONTANA.

The profits of the Anaconda company for the year just drawing to a close are estimated at upwards of $2,000,000, and the Boston and Montaua will show a net earning of at least $750,000, or $5 per share.

SOUTH DAKOTA.

THE RICHEST SPOT.—*Chronicle:* The region known as the Southern Hills is coming to the front as a rich gold bearing section. The old and time worn saw, so frequently heard: "There are no valuable mineral deposits in the Southern Hills," has been relegated to the rear by the discovery of the richest mines of the Black Hills region within her limits. It is hut a repetition of all mining countries; the richest portions are always run over to secure the conveniently acquired surface product, which must he exhausted before considerable effort is made to explore the hidden depths of nature's mineral treasury.

IDAHO.

PIERCE CITY DISTRICT.—Wallace *Miner*: The old Oro Fino mining district, the oldest gold camp in the West, we believe, outside of California, has been the scene of considerable activity during the past summer, and the future for it is brighter than it has been for years past. Up to two years ago the district had been almost abandoned by white men and practically given over to Chiuamen. The past summer has witnessed a marked improvement. Nearly 150 men have formed what may he called the permanent summer population of the camp, and there have been prospectors coming and going by the score. There are probably 100 Chinamen in the district, most of whom are in Pierce City.

Although in this county, Pierce City is a long distance from the Cœur d'Alenes. It generally takes ahout four days and a round-about journey of 300 miles to make the single trip. Pierce City is nearly seventy miles from Kendrick, the nearest railroad station.

No less than six hedrock flume enterprises are under way in the district. The work has been vigorously pushed during the summer, hut it has been mostly in the direction of getting ready, and no amount of gold can be taken out till next summer. But they give promise of heing great money makers.

Quartz has received a great deal of attention, and a number of good ledges have been located. Four or five of these are being developed during the winter, and on one of them a prospecting stamp mill has been in operation since last August.

Individual placer mining has been largely followed. Pierce City mining district covers a large area, and every creek and tributary in it yields gold. Old ground in some cases has been worked over, and numerous patches of new and rich placer have been discovered. Dozens of men, many of them inexperienced in mining, have gone in there during the summer, taken out sufficient gold to live on and returned to the outside with enough to tide them over the winter. While there is nothing big about this, it is a most independent way of enduring the hard times. And while there is nothing to excite a rush to this district, it is a most promising field for the prospector and a place where hundreds of men hy industry can be assured a living and fair remuneration.

It is estimated that over $100,000, probably $125,000, has been taken out there during the past year. The hedrock flumes and other work under way this season will largely increase that output next year.

Thirty-five or forty white men have made arrangements to winter there.

Coast Industrial Notes.

—The C. & C. Ry. Co. will build a new line of road from Winnemucca, Nev., to the new and promising mining camp of Kennedy.

—A carload of sequoia giganten lumber was shipped from Fresno last Monday to Europe, via New York, to be used in making lead pencils.

—The oyster-plant experiment in Willapa bay, Wash., is successfully begun at Bay Center, where a protection reserve of ten acres has been set aside.

—According to the Lodi *Review-Budget*, a project is on foot to build an electric railway between Lodi and Stockton, and rights of way have been secured.

—The McGlew Concentrator Co. has recently sent one of their machines to Mazatlan, one to L. P. Drexler in Oregon, and another to Silver City, Nev.

—Parke & Lacy have recently shipped a Dodge pulverizing plant to the Sahguah C. M. Co., Yuma, Arizona, and a complete outfit of rock drills to Alaska.

—A new diamond coal drill, capable of going down 2700 feet, will be used to test the existence of coal in the vicinity of Scow bay, opposite Port Townsend.

—The Oakland estuary has been dredged for a mile, making a channel 300 feet wide and six feet deep, in the bottom of the bed, by the United States Government during the past year.

—The Cal. Navigation and Improvement Co. have renewed the enterprise of twenty-five years ago, and opened steamboat navigation on the San Joaquin and Tuolumne rivers as far as Modesto.

—In Santa Barbara county a company has been organized to sell water at $1000 an inch. Two hundred prospective purchasers have already agreed to pay that price, the water to be used for irrigation. It is a little high.

—The Thorpe Mining Company filed articles of incorporation in this city last Wednesday. Directors—G. A. Schuster, C. A. Ingerson, F. Ench, J. C. Bauer, Robert Z. Johnson, L. Allgewahr and F. H. Rosenbaum. Capital stock, $500,000.

—A cedar tree 407 feet in height and measuring seventy feet in circumference at the base was felled last week near Ocosta, Wash. It was sixty feet to the first limb of the tree, and the limb itself was seven feet in diameter. It is estimated that the tree will furnish 100,000 feet of boards, enough to make over 100 carloads of shingles.

—Dr. Emmon's two-foot gauge railroad is in rapid process of construction from Amador toward Gnlt. It is the first road of that gauge in this State, and its first cost and running expenses are, of course, very light. The passenger cars are fifty feet long and six feet wide, and will seat thirty people. The money needed for its completion and equipment is furnished by Chicago men.

—J. A. and B. A. Jeffrey, of this city, have secured a patent for an electric dental engine, a case swiveled upon the outer end of a bracket, within which a motor armature rotates; a two-part shaft, upon one part of which the motor armature rotates within the case, while the other is journaled in a sleeve, and a clutch connection between the parts of the shaft.

—A Seattle, Wash., press dispatch says the whole Newcastle coal mine appears to be on fire, and it is feared that the mine will become a total ruin, involving a loss of $500,000 to the Oregon Improvement Company. Coal creek is pouring into it, but will take several weeks to thoroughly flood it, and when the fire is extinguished it will take four or five months to pump the water out. About 250 men are thrown out of work.

—The Golden State and Miners' Iron Works is building a Harding 80 H. P. marine gas engine for one of Hayward's lumber schooners. This is believed to be the largest gas engine ever built in this State. They have recently sent a complete plant to the Altoona Quicksilver Co., in Trinity Co., and two sectional outfits, comprising stamp mills, etc., to Guaymas and Mazatlan. They are building a Ball valve engine, 24x30, for the Caspar Lumber Co., of Mendocino Co.

—"The San Diego Pacific Railroad" is a new scheme now flooding the mails with prospectuses directed to railway employes. It is called by its projectors "a railroad for railroad men," and the idea as set forth is to issue stock at $10 per share, payable in monthly installments of 50 cents. The promoters desire all railroad employes to become stockholders in the road, which will be built from San Diego, Cal., east, and they figure that if 100,000 employes take stock, it will furnish capital sufficient to build five miles of the road per month. The A. R. U. strikers who are on the black list are particularly invited, as it will afford them employment.

—In Tulare the Sunset irrigation district people have let a contract to the amount of $1,500,000, and an equal amount of bonds was sold at par. The deals were made with P. Y. Baker of Traver, who represents San Francisco capitalists. The main canal to be constructed will be about twelve miles long, which is expected to carry water enough to irrigate 300,000 acres of land. Less than one-half the land will be reached by water running in the ditches in the ordinary way, and for the remainder a system of pumping plants will be put in to overcome the rise, pumps being used capable of lifting 120 cubic feet of water per second. The water will be taken from the North Fork of Kings river.

—The U. S. S. McArthur is now at the dry dock of the Fulton Engineering and Ship Building Works having a new copper plating put on. Soon after New Years she and the Gedney will begin a new survey of the entrance of San Francisco bay. The Golden Gate has not been surveyed for more than a generation. The captain of the Gedney says: "The Sacramento river emptying into the bay with its debris for fifty years is bound to make many changes, and the Government has decided that the best course to pursue to prevent accidents is to make a new survey of the whole entrance. The bar is in a bad condition and the pilots are beginning to doubt their old charts, so many differences do they find. There is a possibility of the bar becoming impassable. In that case dredging would be out of the question, and a jetty would have to be built which would cost an enormous sum of money. Of course we know nothing concerning it now, but will soon find out when we get to work next month."

—H. E. Huntington proposes to use an immense water system in San Bernardino county. He says: "We shall use the water from the Mohave river, taking it out of the river four miles above Daggett. We already have four miles of main canal built and seven miles of laterals, putting about 1500 acres under irrigation. The land has been experimented with sufficiently to prove that it will grow vegetables of all kinds and deciduous fruits. As soon as the rainy season is over we shall put in a submerged dam and have works planned which will cost $300,000 or $400,000. There will be tributary to our system about 240,000 acres of land, though it will take several years to put it all under irrigation. We will develop power there, too. Near Mineola, our new town, there will be a waterfall of a vertical drop of 100 feet. Out of every 1000 inches of water we are going to get 250-horse power engines, which will be used to drive the machinery at the mines in the Calico district."

—J. Norbom, attending to the mining machinery department of the Joshua Hendy Machine Works, who has just returned from El Dorado county—where he has been superintending the erection of mills built by his firm this fall—reports they have built a forty-stamp mill at the Lucille mine, at Plymouth, Amador Co.; twenty stamps at Nashville, El Dorado Co.; five and ten-stamp mills in Grass Valley; ten-stamp mills in Siskiyou and Calaveras counties; and are now building fifty stamps at the Grand Victory mine, El Dorado, and adding ten stamps to the present mill at Oro Fino mine, El Dorado Co., besides several hoisting and pumping plants. The mills above referred to are all having very heavy stamps, 1100–1200 pounds, using short drop, to enable the camshaft to run at a high number of revolutions, thereby giving the stamp a quick drop, increasing the splash in the mortar and causing a greater discharge. The new mortars gotten up for this kind of mill are very heavy and longer than the old-style mortars, giving them about twenty-five per cent more screen surface than usually has been the custom.

A thoroughly competent Amalgamator wants a position where mine and mill assaying is required. References given. Address Box D, this office.

RUPTURE!

It has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

DELINQUENT SALE NOTICE.

GARNER CONSOLIDATED GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Mokelumne Hill Mining District, Calaveras county, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 1), levied on the 26th day of October, 1894, the several amounts set opposite the names of the respective shareholders, as follows:

	No. Certificate.	No. Shares.	Amount.
W. T. Robinson.....	7	25,000	$1,250 00

And in accordance with law, and an order from the Board of Directors, made on the 26th day of October, 1894, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, Room 56, No. 309 Montgomery street, San Francisco, California, on THURSDAY, the 27th day of December, 1894, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. STADTFELD, JR., Secretary.

Office, Room 56, No. 309 Montgomery street, San Francisco California.

OUR PIPE IS FOR SALE.

For Hydraulic Mining and Irrigation Purposes Our Sheet Iron and Sheet Steel Riveted Water Pipe Is Unexcelled.

We Have Also a Large Line of the MATHESON JOINT (Lap-Welded) Pipe, for Which We Are Agents.

Our Prices Are Low; Our Pipe Is Superior, and We Want More Business. May We Quote You Prices?

PIPE FITTINGS, TOO.

Electrical Progress.

Destructive Arcing of Five Hundred Volt Fuses.

Read before the American Street Railway Association, Atlanta, Ga., Oct. 18, 1894, by W. E. Harrington.

The destructive effects of the arc accompauying the opeuing of 500-volt circuits and switches, lightniug arresters and fuses has led the writer to inquire into this phenomenon, particularly iu reference to fuse practice. A series of carefully couducted tests were made to find the relatiou. between the fusing curreuts of different size copper wires ranging from No. 30 to No. 21, Brown & Sharpe gauge, the time required to open the circuit, and to what extent the arc contributed to the time required.

Au iuclined trackway was constructed, haviug two copper tracks upon which a traveler consisting of a block of hard wood having copper plates in contact with the tracks could be run, the circuit from rail to rail of track being completed through an electro-magnet on top of the traveler. Parallel with and alongside of the track was a raised board on which a paper was attached.

An impress was made on paper by a lever on the traveler when relcased by electro-magnet, owing to stoppage of current.

Before tests were made the trackway was carefully calibrated as regards time for travelcr to go from top to bottom and the intermediate points, resulting iu knowing the time to $\frac{1}{100}$ of a second.

The tests were conducted across the bus bars of switchboard of the Camden Horse Railroad Compauy, Camden, N. J. Average voltage, 515 volts.

Before throwing a fuse in circuit, a water rheostat was set, usiug a Weston ammeter for this purpose, so that the current desired would flow through the fusc, when the circuit was completed by the traveler on the trackway.

The different size fuse wires were subject to the followiug limitations: The time of the traveler running full leugth of the trackway, 1.5 seconds; the current rangiug from 20 to 130 amperes iu 10 ampere steps.

The smaller fuse wires would fuse with the minimum current of 20 amperes, and in all iustauces inside of 1.5 arc limit, consequently the curves show a wide range; but in the larger size wires a greater current was required to fuse the wires iu the 1.5 seconds limination, consequently the curves giveu for the larger fuse wires show less and less range as the fuse wires increase in size.

Iu order to strike an average the tests were repeated under similar conditious as regards current and gauge wire with a three-inch horizontal fuse, a six inch vertical fuse, both of which were connected to a standard form of fuse block, also a four and one-half iuch fuse, the average in leugth of the three inch and six inch, was employed, connected in a specially constructed fuse block, which absolutely prevented any arcing of the terminals. In other words, the fusing of the fuse wire could uot burn the terminals to which it was attached. The results give the time required in fractions of a second for the circuit to be opened under identically similar conditions as regards current and gauge of wire for a three inch, a six inch unprotected and a four and one-half inch protected terminal fuse.

The curves illustrate excellently the erratic character of the fusing of wires under conditions as observed in the practice of to-day.

The time required to open a protected terminal fuse wire becomes less and less as current increases and grows less regularly, showing that a regular law is followed. The curve is a hyperbola having its asymptotes for its axes, and the equation for it is $xy = 13$ for No. 28 copper. Whereas, the two unprotected terminal fuses are uncertain and show in a very pronounced manner wherein the terminals contribute to this eud, the conclusion one is forced to draw is that a fuse wire in practice, when it fuses, does not do as it was intended to—open the circuit—but establishes a condition, though the time may be limited, wherein the terminals act as a magazine to furnish the gas through which the circuit is continued. The curves throughout do not show any superiority of the six inch fuse over the three inch. Looking at the results in comparison, as given by the Board of Fire Underwriters, which is attached to this paper, the very point they should have observed was overlooked, to wit, the continuauce of the arc through but a short period of time at the expense of the terminals, and the possibility of the vicious gas thus generated coming in contact with other circuits and establishing other and more serious conditions, such as short circuits and possible fires.

Not to be misunderstood, while the tests, as are herein recorded, show no superiority of the six-inch unprotected terminal fuse wire over the three-inch uuprotected terminal fuse wire, the six-inch fuse wire is uuquestionably safer wheu conditions are more extreme, such as, for instance, wheu a short circuit occurs.

The determining factor in this matter of fuses is: What are the conditions required to protect against absolute short circuits across the bus bars of a large power station 500-volt switchboard? Tests are conducted showing how fuses act under conditions that are predetermined, certain currents which are made to flow, etc., but you uever see anything published or advice given in this matter of fuses for the condition which really occurs the most frequently—that is, absolute short circuits. The Board of Fire Underwriters' report, herewith attached, gives the differeut length fuse blocks required for 10 amperes, 20, 30, 40 and so on.

Now the requirements aud limitations as prescribed iu the Board of Fire Underwriters' report are true and perfectly safe when the fuse "blows" under the conditions as outliued in the tests, as made by the committee appointed to make such tests.

But on an absolute short circuit across bus bars, as above stated, a ten-ampere fuse block constructed as specified will, instead of protectiug one when most iu ueed of such protection, burn up in the most vicious way aud will opeu maguetic cut-outs in a power station requiring currents up to a 1000 amperes to open. Understand, the fuse does not itself do this, but the arc established at the expense of the terminals is the immediate and sole cause, and the circuit must be opeued elsewhere. As stated, the magnetic cut-outs, above referred to, open the circuit.

This matter of arbitrarily adopting a series of fixed dimensions and conditions uuder which fuses are to be used is absurd, aud is very similar to a case which came up on the railway with which I am connected.

A man came to the presideut with a car fender, which he was anxious to have adopted. After expatiating for some time upon its merits it finally came out that under certain conditions the fender was really good, and if a person should fall in one particular way the fender would surely save him; and he promised to send printed instructions with each fender, so that the people could be instructed to fall properly.

The conclusions one is forced to draw from the above tests and the general literature upon the subject of fuses are as follows:

1. The proper and only fuse block to be used is one having protected terminals.

2. That fuse blocks should be furnished so that the terminals would not be burned under conditions approaching an absolute short circuit across the bus bars of a 500-volt power station.

3. The magnetic cut-outs are immeasurably preferable under all circumstances.

APPENDIX.—REPORT OF UNDERWRITERS' INTERNATIONAL ELECTRIC ASSOCIATION.

Data.—The following data gives the maximum length between terminals at which arcing occurs, the minimum lengths at which no arcing was observed, and the safe lengths on 500-volt circuits for fuses, whose melting points are ideutical with the various current strengths desiguated:

Amperes.	Maximum length at which arcing occurred. Inches.	Maximum length at which no arc was observed. Inches.	Safe Lengths.
10	¼	½	1
20	½	¾	2
30	2	2	2¾
40	2	2¼	3⅜
50	2¼	2½	3½
60	3	3¼	3¾
70	3	3¼	4
80	3¼	3½	4⅛
90	3½	3¾	4⅝
100	3¾	4	4½

THE Electric Bureau of the Chicago Uuderwriters' Association has issued its fifth report, giving valuable information concerning the fires which have been the result of electric currents. It says that there are many ways in which a fire may be caused by an electric current, from a plain case of a naked wire coming in contact with combustible material to a complicated circuit. It mentions the case of a cross between the guy from the derrick coming in contact with the metal on the roof of the buildiug, a soil pipe passing up through the building and through the roof making connection with the metal of the roof. A current was conducted into the building by the guy wire, the metal roof and soil pipe, and grouuded on a water pipe, burniug a hole ten inches long, and also burning two holes iu the soil pipe, flooding the building with water but doing no other damages. In auother case reported an arc wire chafed against an iron chimney till the insulation was worn off, and the current followed down the chimney and passed to two guy wires, one of which was attached to the frame bell tower of a fire department headquarters. Arciug occurred in the tower and ignited the woodwork. The chief of the fire department was knocked down and nearly lost his life by placing his haud on the base of the metal chimney while standing on the metal roof. The accident occurred during a heavy wind and rainstorm. Crossing of wires, short circulating aud other causes resulted iu huudreds of fires from April 10th to October 10th, the time covered by the report.—Fire and Water.

THE compressed plates now in the market constituting the ordinary form of accumulators are all that is desired when both size of plate and quantity of current is available, but as regards the time required in charging the same, together with their abnormal weight, renders them altogether useless for the lecture table. To obviate this difficulty, H. N. Warren, after a lengthy research upon the subject, has succeeded in producing a small secondary cell of great delicacy that can be readily charged from a constant battery, retains double voltage and can be arranged to auy number of amperes. The small plates being arranged in pairs within a specially prepared receptacle containing dilute acid, the oxides on each plate being protected by means of indestructible tissue, rendered porous and maintaining the oxides in the paste condition, they may be readily charged for short experiments in about an hour; and which in series are capable of produciug great intensity, being manufactured at half the cost of other accumulators.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

SITUATION WANTED BY ENGINEER AND machinist who understands the running and care of electric plants. Engagement preferred with parties interested in the use of electricity for the reduction of refractory ores. WM. H. RUE, 242½ 12th St., San Francisco, Cal.

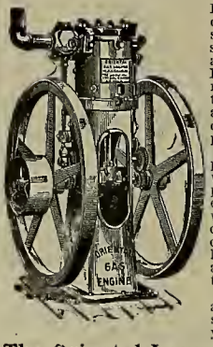
The Oriental Gas Engine



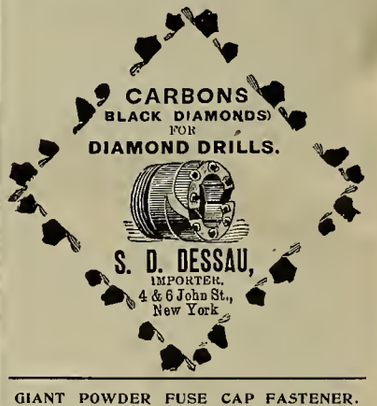
IS THE BEST because it combines simplicity of construction with power and economy of space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosions. No licensed engineer at a high salary needed to operate it.

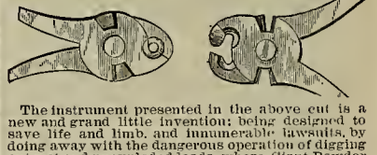
Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

M. A. GRAHAM,
Inventor and Manufacturer,
105 Beale Street..... .....San Francisco.



GIANT POWDER FUSE CAP FASTENER.



The instrument presented in the above cut is a new and grand little invention; being designed to save life and limb, and innumerable lawsuits, by doing away with the dangerous operation of digging out wet and unexploded loads, where Giant Powder is used in mining. The instrument is made of the finest cast steel, and crimps the cap on the end of the fuse *firmly* and *absolutely water tight*. There is also a Fuse Cutter attached. **Price 75c. each.**

Practical Information.

Petroleum as a Lubricant.

A Chicago engineer says of petroleum that its peculiar advantages as a lubricant over all other oils are its non-oxidizable properties—that is, its freedom from gumming and acids. All other oils—animal, fish and vegetable—which were used prior to petroleum are, he continues, destructive to metals, and this destructive action is more noticeable where these oxidizable oils are used to lubricate the valves, cylinder and other internal parts of the steam engine. This destruction is accelerated by the high degree of steam heat, which causes the quick generation of stearic, margaric and oleic acids, that rapidly act on the metal surfaces, honeycombing them and eating them away. The uniform temperature where machinery is operated is a very important factor, as well as the uniform gravity and cold test of the oil to lubricate it, as is illustrated by the ordinary drop-feed lubricating cup, which is regulated by the opening or closing of an aperture near its base. It is plainly to be seen that as often as the temperature of the atmosphere changes, or the gravity or cold test of the oil is changed, so will the quantity of the oil fed through the aperture of the cup vary in furnishing the uniform quantity necessary to lubricate the machinery properly. Many expensive accidents have been caused by neglecting to observe the above.

Death is Painless.

Dr. Cyrus Edson, in *North American Review*, says: "Nothing is more common than to hear from the pulpit pictures in words of excitement, of alarm, of terror, of the death-beds of those who have not lived religious lives; yet, as a rule, if these pictures are supposed to be those of the unfortunates at the moment of death, they are utterly false. In point of fact, ninety-nine of every hundred human beings are unconscious for several hours before death comes to them. All the majesty of intellect, the tender beauty of thought, or sympathy, or charity, the very love of those for whom love has filled all waking thoughts, disappear. As a little baby just born into the world is but a little animal, so the sage, the philosopher, the hero, the statesman, he whose thoughts or deeds have writ themselves large in the history of the world, becomes but a dying animal at the last. A merciful unconsciousness sets in, as the mysterious force we call life slowly takes leave of its last citadel, the heart, and what is has become what was. This is death."

Underwear Made from Peat Fibers.

Underwear made from peat is quite extensively used in France. It has been known for some years that peat has certain antiseptic qualities. A dead body, which was buried in peat for over a century, was found in a state of perfect preservation. Peat is used in the northern countries of Europe for surgical bandages, and the favorable results obtained by the Russian surgeons with peat bandages have induced the French Army Department to use it in the French hospitals. It has also been found that peat fibers, in combination with other materials, possess wonderful absorbing properties. This has led to the use of peat fibers for the making of underwear instead of flannel. The new material has proven very effective, absorbing perspiration and rapidly drying. The inventor calls his fabric a "real hydraulic pump," and pronounces it an excellent preventive of colds.

A Wire Fly Wheel.

Among recent novel applications of wire, perhaps none has greater interest to the mechanical world than that presented by the new wire fly wheel lately erected at the Mannesmann Tube Company's Works, Germany. Heavy fly wheels driven at high velocities obviously present dangers of breaking asunder from the great centrifugal force developed. The wheel at the factory mentioned consists of a cast-iron hub or boss, to which two steel-plate discs or checks, about twenty feet in diameter, are bolted. The peripheral space between the discs is filled in with some 70 tons of No. 5 steel wire, completely wound round the hub, and the tensile resistance thus obtained is far superior to any casting. This huge fly wheel is driven at a speed of 240 revolutions per minute or a peripheral velocity of about 2.8 miles per minute, which is nearly three times the average speed of any express train in the world. The length of wire upon such a constructed fly wheel would be about 250 miles.

EXPERT naval engineers admit that "there are some things yet to be learned concerning the triple screw," but they say that its success for power and speed has been amply demonstrated. Commodore Melville claims that not only speed, but maximum fuel economy will be reached through the independent action of each screw, the center one alone being used for slow cruising. A schedule of test, made up from the performance of vessels like the Columbia and Minneapolis, has been prepared, showing the working of the triple screw.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 20, 1894.

During the week silver went below the 60 mark. The present quotations are mainly nominal, the market heing in a passive condition, futures depending on pending and probable legislation. The Chinese indemnity also cuts considerable figure in the case. It is understood that Japan will demand and probably secure an indemnity of $500,000,000. Both countries are on a silver hasis. There are now about $5,000,000 of free silver in the world; it is also evident that should Japan demand the payment of the indemnity in gold, such amount could not possibly he forthcoming. Wben France paid Germany the $600,000,000 indemnity in 1871, it was in gold, and upon Germany's receiving that vast amount it estahlished, practically, a gold standard in the latter country. The question is an important one and gives a silver lining to tbe present dark cloud on the interests of the white metal.

Regarding lead, an exchange says: "The agreement of all the lead corroders of the country, after a lively session of two days and two nights, is of great importance to the trade, as it means better prices for all interested and freedom from tbe friction wbich has sometimes been very decided.

"A good deal of the adverse criticism of the National Lead Company has come from outside producers who were unable to make money where the National Lead Company, with its facilities and capital, could make it. Practically all the adverse comment of the National Lead Company can he traced to these sources.

"The agreements which have been reached will firmly estahlish trade and prices on a basis better tban they have recently been in this country."

New York Prices.

NEW YORK, Dec. 20.—Following are the closing prices for the week:

Assay office attached.

O. C. WILBUR & CO.

Mining Share Market.

SAN FRANCISCO, Dec. 20, 1894.

There is but little change in prices or prospects of Comstock or other stocks, the same apathy which characterized the entire year continuing to its close, the condition of the mines having little to do with the condition of the market, which has been petty throughout. Delinquent assessments have been a feature.

In California, Nevada, Arizona and South Dakota there have been 77 mines in '94 that have levied from one to four assessments, the number heing 138, aggregating $1,579,600 called for. Of these California has 29 mines, asking for $178,500; Nevada 41, with a total assessment of $1,263,600; Arizona 3, $60,000; South Dakota one, $25,000; and Mexico 3, $29,250.

The *Bulletin* reports the number of assessment mines and the amounts collected from year to year to compare as follows:

Years.	Mines.	Amount.
1883	148	$5,885,784
1884	120	4,724,700
1885	105	2,701,150
1886	86	3,024,674
1887	97	3,137,360
1888	90	3,750,300
1889	92	2,999,050
1890	89	2,392,460
1891	90	2,925,540
1892	81	2,566,320
1893	78	2,196,280
1894	75	1,543,600
Total assessment 12 years		$37,847,218

The superintendents, miners and business men of Virginia City and Gold Hill have contributed $2101 for the orphans of St. Mary's School.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENHINO DECEMBER 11, 1894.

530,675.—DREHGING MACHINE—J. A. Ball, Grass Valley, Cal.

530,678.—HOSE SAMPLES—W. F. Bowers, S. F.

530,506.—FRUIT DRIER—J. M. Coulter, Portland, Or.

530,682.—SCAFFOLD—R. O. Davis, S. F.

530,529.—WRAPPING MACHINE—I. R. Hutchinson, Fresno, Cal.

530,708.—CAR COUPLING—J. McDonogb, S. F.

530,716.—FIRE KINDLER—F. R. Pearson, Vancouver, Wash.

530,852.—DOOR SPRING—A. D. Phelps, Galt, Cal.

530,655.—FISH LADNER—J. A. Richardson, S. F.

530,663.—FAUCET—A. C. Sbaw, S. F.

530,666.—DOOR BELL, ETC.—J. T. Stone, Oakland, Cal.

530,667.—DOOR BELL, ETC.—J. T. Stone, Oakland, Cal.

530,565.—CAR COUPLING—S. N. Wasbburn, Olympia, Wasb.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FISH LADNER.—James A. Richardson, San Francisco. No. 530,655. Dated Dec. 11, 1894.

The object of this invention is to provide a means for enahling fish to pass up over dams and other obstructions, to form resting places for them ou the way up, and to so construct the device that it is guarded from breakage by timbers and drift which may come down the stream during high water. It consists of riffles fixed transversely in a cut or channel in tbe dam or obstruction, with their upper portions at different levels and below the surface of the water so that wells or pools of quiet water are formed between the riffles, while the more rapid water flows over the top of tbe riffles without disturbing the water in the pools. In conjunction with these wells or pools there may be used an inclined imperforate apron upon which vertical cross-riffles are fixed to provide these spaces, and inclined planes or aprons so arranged with relation to the tops of the riffles as to protect them from driftwood or logs.

DOOR BELL ANN BURGLAR ALARM.—John T. Stone, Oakland, Cal. Nos. 530,666 and 530,667. Dated Dec. 11, 1894. The object of these inventions is to provide simple, cheap and easily operated mechanism wbich may be attached to doors, windows and analogous devices in sucb a manner that tbe opening of either will set the mechanism in motion and give an alarm to indicate that the door or window is being moved. In conjunction with this, in one device, is a supplemental mechanism which allows the same bell to be used as a simple door or call bell, independent of tbe automatic mechanism. It consists in the combination of a bell with a gong and hammer; an escapement by which the hammer is caused to continuously strike the gong; a pinion mounted upon the shaft of the escapement wheel; a gear engaging said pinion; a ratchet and pinion turnahle together aud a spring pawl fulcrumed upon the gear to engage the ratchet when turned in one direction, and to allow it to move freely in the opposite direction; a segmental rack engaging the pinion of the ratchet and fulcrumed at one side of the bell plate, and a diagonally arranged lever fulcrumed between its opposite ends, having one end connected with the arm of the rack and the other engaging the door jamb so that the motion of the parts is multiplied, and the movement of the door is communicated to the mechanism so as to ring the hell. By means of suitable mechanism the call may be sounded hy turning the handle without affecting the automatic mechanism, and the latter may, in turn, be operated without disturbing the bandle of the call alarm.

ADJUSTABLE BRACKET SCAFFOLD.—R. O. Davis, San Francisco. No. 530,682. Dated Dec. 11, 1894. This invention consists of a framework supporting the floor of tbe scaffolding, the outer ends of the framework being suspended by pulley blocks and ropes so that the scaffolding may be raised or lowered at will. In conjunction with this are braces so attached with relation to the scaffolding that the latter will be held level and firm and in contact with the side of the building from which it is suspended, and can, at the same time, be raised or lowered with relation to the points of suspension without losing its horizontal position or being forced away from the wall of the building.

FAUCET.—Albert C. Shaw, San Francisco. No. 530,663. Dated Dec. 11, 1894. This invention relates to a faucet and connections by which the liquid may be drawn from the cask or receptacle and the liquid can be charged with carbonic acid gas through the same device so as to keep it always in sharp condition and under suitable pressure. It consists of a faucet, a barrel having a main discharge passage and chambered extension provided with exterior threads, tbe nuts fitting said chamber, and a connection for delivery pipe having a flange in its upper end adapted to fit and be retained in contact with the chamber, and a mechanism by which gas can be introduced through a supplemental passage by means of a peculiarly constructed valve which allows the free admission of gas and prevents its return.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

Educational.

MINING

TAUGHT BY MAIL 4500 STUDENTS

DIPLOMAS AWARDED. Courses in other trades, all including thorough instruction in Mathematics and Physics. Send for FREE Circular, stating subject you wish to study, to **The Correspondence School of Mines, Scranton, Pa.**

Belmont School,

BELMONT, CALIFORNIA,

25 Miles South of San Francisco.

- BUILDINGS heated from a central steam plant, and buildings and grounds lighted by electricity.
- BOYS perform their own experiments in well-equipped chemical and physical laboratories.
- GYMNASIUM 99x79 feet, furnished with very best apparatus, including shower baths, under special teacher of physical culture. . . . .
- SCHOLARSHIPS for young men of fine character and ability. Accredited at Stanford and at the University of California in all the subjects of all the courses and in advanced physics, chemistry and mathematics. . . . . .
- REFERENCES required. Views of Belmont School and Catalogue sent by applying to **W. T. REID, A. M.** (Harvard), Head Master. . .

HEALD'S

Business College,

24 Post Street, - San Francisco.

FOR SEVENTY-FIVE DOLLARS

This College instructs in Shorthand, Type-Writing Bookkeeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for full six months. We have sixteen teachers and give individual instruction to all our pupils.

A Department of Electrical Engineering

Has been established under a thoroughly qualified instructor. The course is thoroughly practical. Send for Circular. C. S. HALEY, Sec.

ACTUAL BUSINESS PRACTICE.

Established 1863. **PACIFIC Business College, 320 POST ST. SAN FRANCISCO.** Day and Evening Sessions.

Rates of Tuition Very Moderate.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON. President.

Books on Working Ores.

BY GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisc.

BY C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes), $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

RISDON IRON WORKS.

Office and Works: Cor. Beale and Howard Sts., San Francisco.

Cable Address: "RISDON'S" San Francisco.

MANUFACTURERS OF

Johnston's Concentrator, Bryan Mills,

Challenge Ore Feeders, Air Compressors,

MINING, MILLING, PUMPING and HOISTING PLANTS.

The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

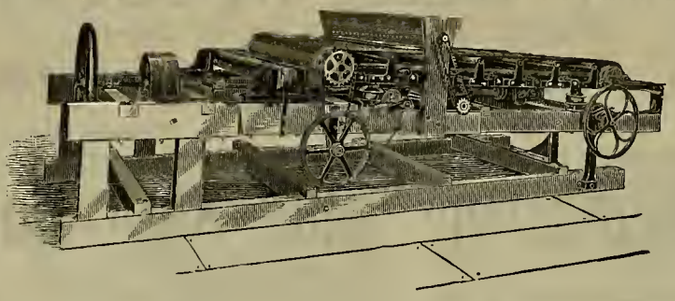
NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness, combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.



FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE McGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94¼ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES
For Saving Gold

IN QUARTZ, GRAVEL OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

GLADSTONE MINING COMPANY, FRENCH GULCH, Shasta Co., Cal.,
C. J. Clark, M. E., Gen'l, Supt. Dec. 12, 1894.

MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIRS: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the FRUE in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to to mention. In order to give an idea of the work they are doing here, I will state that the ore has varied monthly from $5 to $20 per ton and the tailings from nothing to 50 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

The Best Paying Mine.

The higgest gold mine in the world is now being worked in Wall Street, New York. Originally a surface formation, it has developed into a well-extended ledge of unusual size, and is heing worked for all it is worth. No mining machinery is hought, and there are no assessments. Last month a dividend of $1,200,000 was declared on one week's operations, in addition to the regular profits. Neither the Utica of Angels nor the Kennedy of Amador can compare with the profit derived from the Wall Street mine, and the wonderful yield of the Witwatersrand is only a pocket when compared with the freest of free gold, 900 fine, that is produced in the auriferous workings of the clever Eastern syndicate. In after years, when the marvelous tales of '49 are told to unhelieving ears, it may be that the mines of '94 will he hut a myth, but at present they are a reality. Those mines are a monopoly and are protected hy the highest officials; whenever the profits are not up to the avaricious desires of the participants in the scheme, a little enlivener known as "a hond issue" makes merry the minds of the manipulators. It is not a wildcat mine, this gold discovery of Wall Street, hut it is a dishonest method of mining, and deserves suppression. Strict compliance with the national law (which in this case runs in parallel lines with common sense) would summarily end this swindling mine, which discredits the Government and those of the Government's servants who make such methods possihle.

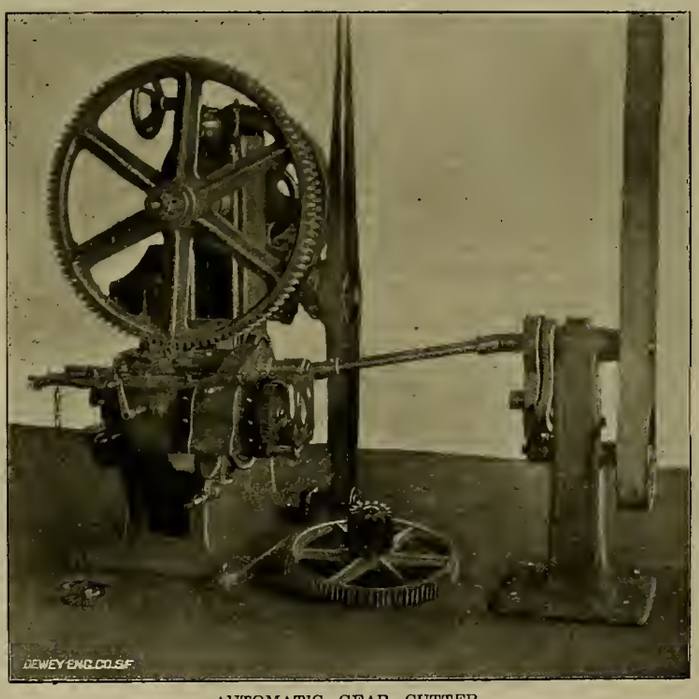
Effort is heing made in Fresno county to do the same kind of work in which so much time and money have been expended on the Feather. A large force of men is at work tweuty-five miles from Fresno, changing the channel of the San Joaquin river. It is the purpose to divert the flow of water so that the gravel near the mouth of Fine Gold river can be reached. Divers in the pool formed there have brought up many indications of great richness in gold, and the projectors, who are principally Ohio men, are sanguine of success. The present proposed work consists of a canal forty feet wide and 600 feet long to carry the water away from the present stream, leaving it dry.

The State of Washington is asking for an appropriation for a State geologic survey. The interests of the miners and the dwellers in general in that State require the formation and maintenance of a mining hureau and a systematic geologic survey, but that commonwealth needs honest officials to fairly carry out the provisions of the appropriation. This it has uot had in that department of puhlic work. Prohahly if the Washington Legislature were satisfied that the money would be honestly expended such appropriation would be forthcoming.

An unconfirmed report is traveling around that beginning with the new year miners on the Comstock will have to work for $3 per day, and that in case they will not accept the reduction the mines will close down. That has been prophesied before.

Automatic Gear Cutter.

Messrs. Van Drake and Taylor, the well known expert machinists of this city, have just added to their already well equipped establishment one of Gould & Eherhardt's gear cutters. The machine will cut spur, bevel and worm gear of any pitch, coarse or fine, up to a diameter of fifty inches. Being automatic in action, it requires but little attention beyond proper adjustment for the work in hand. The blank casting is placed in position, with a suitable cutter for gear required, and the machine does the rest, announcing the finish of the job by the stroke of a hell. A perfect gear is now removed from the machine, requiring no filing or hand work of any kind. This is the only automatic gear cutter on this coast of like capacity, and as it is intended for job work and can do the business more cheaply than by any other method, doubtless manufacturers and others having gears to cut will avail themselves of its use. The accompanying illustration shows the machine cutting a forty-eight-inch gear. It can be seen working at 523 Mission street.



AUTOMATIC GEAR CUTTER.

Seldom has any journal received a higher compliment from a higher source than a notification to this paper from the United States Committee on Awards of the World's Columbian Exposition at Chicago that it had received an award for its general excellence and reliability, and the fullness and accuracy of its reports. That is high praise and is appreciated.

The American Federation of Lahor at Denver decided against compulsory arbitration. It is hard to see how any other decision can be logically reached by any federation of labor or capital. As J. D. Weeks puts it:

> If you compel a man to work at a price he doesn't want to work at, that is slavery. If, on the other hand, you compel a man to pay wages that he doesn't want to pay, that is confiscation.

The Income Tax.

It is announced from Washington that the income tax will he enforced in '95. As incomes below $4000 annually are exempt, the new form of raising revenue will not hother the most of us very much. When called on, answers to the followiug are required:

1. Gross profits of any trade, business or vocation, wherever carried on.
2. Rents received or accrued during the year.
3. Profits from sale of real estate purchased within two years.
4. Farming operations and proceeds.
5. Money and value of all personal property acquired by gift or inheritance.
6. Premium on honds, stocks, notes and coupons.
7. Income from trade or profession not by stated salary and not heretofore enumerated.
8. From salary or compensation other than that received from the United States.
9. Undivided gains and profits of any partnership.
10. Interest received or accrued from all notes, honds or other securities.
11. Interest on bonds or coupons paid of any corporation.
12. Dividends from corporations.
13. Income of wife or minor child or children.
14. All other sources of income not above enumerated.

The deductions allowed in the return therein enumerated are:

1. Four thousand dollars exempt hy law.
2. Interest due and paid within the year.
3. National, State, county, school and municipal taxes paid, not including assessments for local henefits.
4. Amount expended in the purchase or production of live stock or produce within the year.
5. Necessary expenses, specified by items actually incurred in carrying on any business or trade.
6. Losses actually sustained during the year, specified.
7. Actual losses on sales of real estate purchased within two years.
8. Debts contracted and ascertained in the year to he worthless.
9. Salary or compensation over $4000 from which the tax of two per cent has been withheld hy dishursing officers of the United States Government.
10. Dividends included in the estimate of gross profits from corporations on which the ten per cent tax has heen paid by such corporations.

At the Union Iron Works there is now a definite prospect of completing the Oregon, which has heen awaiting the result of the controversy between the United States Government and Andrew Carnegie, regarding the structural weakness or strength of the armor plate. The claim that the plates were defective was tacitly admitted by their maker last fall, when he "compromised" with the Government by paying $140,000 fine. But the Secretary of the Navy had an interview with Mr. Carnegie last Saturday, and Mr. Herbert has accepted the plates, cracks, blowholes and all, and will prohably apologize to Mr. Carnegie who has already demanded the return of the $140,000 fine.

The Union Iron Works has nothing to do with the matter one way or the other, except to put the 420 tons of armor plate in place according to contract as instructed hy the Government. It would be more satisfactory to have positive assurance that a great battle ship like the Oregon had armor plate ahove suspicion of crack or flaw or blowholes; for in times of war the Oregon's antagonist might put those plates to a severer test than even that of the United States Government. Mr. Herhert is careful to explain that the plates when tested were cracked "by a projectile much superior to the ordinary service shot." When the Oregon goes into an engagement the enemy should be requested not to use any projectile "superior to the ordinary service shot," and thus avoid possible disaster.

PRACTICAL INFORMATION.—How to Make Money in the Engine Room; Problem in Railroading, 411.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Meetings; Assessments; Dividends, etc., 414.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 413.

Our Sixty-Ninth Volume.

With this issue closes the sixty-ninth volume of the MINING AND SCIENTIFIC PRESS. Thirty-four years in the life of a journal or an individual is a considerable period, the difference being that the man grows old, while the journal renews its youth, and, in fresh and active progressiveness, only points to the years of its existence as a high claim to popular favor and confidence. The next issue of this paper will be the first of its seventieth volume, the 1795th consecutive issue of the oldest journal of its class in the United States, a paper that has for nearly thirty-five years been recognized as the exponent of the legitimate mining industry on this coast and the constant expositor of all that aids in directing attention to the best industrial interests of this State and city. Technical information of all kinds, a vast number of special and valuable articles and intelligent observation on mechanical industries make a library of information not procurable elsewhere. A glance at the copious index on the last page of this issue shows the variety and value of the articles discussed in the last half year. The subject of electricity in connection with mining has been given special attention during the past year, and will continue to be given the prominence in these pages that its importance demands. The illustrations during the year speak for themselves. Anything and everything in new and improved mining appliances has been graphically depicted. General mining news of the most authentic nature has been given, and in no single instance are we cognizant of any statemeut being made that the facts did not fully warrant. The importance of this remark can best be understood by those who know the assiduity with which promoters of unworthy mining schemes seek to obtain the prestige of publicity in a paper of such standing and influence in the mining and scientific world. During all the busy years since '60 the PRESS has faithfully devoted itself to the development of the mining industries of the west half of America. It has recorded the discoveries, successes and failures, the excitements, rise and fall of many mining camps, has honestly treated all the matters under observation regarding the history and development of the great mining industry in the mineral regions of California, Nevada, Colorado, Utah, Arizona, Montana, Idaho and New Mexico, and during those years has, it is believed, formed such associations and pleasant relations with thousands of men as are given to but few journals to fortunately possess. In many things of merit the PRESS claims to be without a rival. It has seen the rise and fall of many competitors, and with belief in the theory of the "survival of the fittest," it can justly lay claim to superiority as it reviews its thirty-four years of honest and honorable existence. Whatever in its field that is novel, interesting or of value will find first and faithful mention in its columns, and the same generous meed of patronage and support accorded to it in the past will, it is hoped, be equally deserved in the future.

State Mineralogist's Address.

Following is the full text of the address delivered by Mr. J. J. Crawford, State Mineralogist, before the Convention of the Cal. State Miners' Association. Its publication was delayed for purposes of revision and accuracy, the recent accident to Mr. Crawford making such delay unavoidable:

Mr. Chairman and Gentlemen of the Convention:—I have been delegated to present a paper on mining statistics of the State. Now, as statistics are at best a dry subject, and are better adapted to be considered in the quiet of one's office or home, and, as you have been in session now three days, I will spare your feelings and quote but a few.

You all remember the allegorical fountain at the Midwinter Fair representing the State of California with the legend "California, the Land of Sunshine, Fruits and Flowers." The miners were justly indignant that the mining industry, which really created and caused the settlement of California, should not be noticed either in the legend or by a separate building on the fair grounds. Oue would not know from the literature eulogizing the resources of the State that this was a mining State at all, as mining is seldom or never mentioned. Our enthusiastic secretary has sought to rectify the error by adding the word "gold" to the above legend in the painting on this platform; but I am afraid the chief industry of this State—agriculture—would also feel offended, as the gross value of its products is greater than the mineral, horticultural and viticultural products combincd. But it had the satisfaction of having a building all to itself on the fair grouuds. It would be better to have the legend read "California, the Land of Sunshine and Flowers."

As a matter of fact, the gross value of the mineral productions for 1893, as per the following table, was $18,806,261, and a gross value of the horticultural and viticultural productions for the same year was $17,085,000, as per the table following, showing an excess in favor of the mineral productions of $1,721,261.

MINERAL PRODUCTS IN CALIFORNIA FOR 1893.

This statement, prepared by Mr. Chas. G. Yale, Statistician of the State Mining Bureau, shows the amount and value of all the mineral products of the State for the year 1893, this being based on direct returns from producers:

Antimony	50 tons.		$ 2,250 00
Asbestos	50 tons.		2,500 00
Asphaltum	9,150 tons.		161,250 00
Bituminous rock	32,006 tons.		192,036 00
Borax	7,910,563 pounds.		593,292 00
Chrome	3,319 tons.		49,785 00
Clays—			
Bricks	103,900 M.	$801,750	
Pottery uses	24,856 tons.	67,284	
			869,034 00
Coal	72,603 tons.		167,555 00
Copper	239,632 pounds.		21,571 00
Gold			14,422,811 00
Granite			531,322 00
Gypsum—			
Plaster of Paris	180 tons.	$ 3,245	
Wall plaster	240 tons.	2,640	
Fertilizer	1,200 tons.	8,400	
	1,620 tons.	$14,280	14,280 00
Insusorial earth			2,000 00
Iron ore	250 tons.		2,000 00
Lead	333 tons.		24,975 00
Limestone—			
Lime		$288,626	
Flux		12,650	
			301,276 00
Macadam rock	271,500 cubic yards.		256,875 00
Magnesite	1,093 tons.		10,950 00
Manganese	270 tons.		4,050 00
Marble			40,000 00
Mineral paints—			
Iron	30 tons.	$ 900	
Litharge	45 tons.	5,400	
Metallic	212 tons.	4,135	
Ocher	200 tons.	4,000	
Red lead	103 tons.	12,360	
	590 tons.	$26,795	26,795 00
Mineral waters	383,179 gallons.		190,667 00
Natural gas			48,500 00
Onyx			26,000 00
Paving blocks (basalt)	2,770 M.		96,950 00
Petroleum	470,179 barrels.		608,092 00
Platinum	75 ounces.		517 00
Quicksilver	30,164 flasks.		1,108,527 00
Rubble rock	99,600 tons.		199,200 00
Salt	50,500 tons.		213,000 00
Sandstone			26,314 00
Silver			537,157 00
Slate	3,000 squares.		21,000 00
Steatite	400 tons.		12,700 00
Total			$18,806,261 00

HORTICULTURAL AND VITICULTURAL PRODUCTS FOR 1893.

Citrus fruits, 400 carloads at $375	$1,500,000
Prunes, 52,000,000 lbs. at 5½c	2,860,000
Dried fruits, 45,000,000 pounds at 7c	2,750,000
Green deciduous fruits, 160,000,000 lbs. at 1c	1,600,000
Raisins, 85,000,000 lbs. at 2½c	2,175,000
Wine, 22,000,000 gallons at 15c	3,300,000
Canned fruit, 1,000,000 cases at $2	2,000,000
Miscellaneous fruit consumed at home, estimated	1,000,000
Total	$17,085,000

As I said before, the agricultural interests are greater than both of these, the gross amount being $49,750,000; and the editor of the San Francisco *Journal of Commerce* has kindly furnished me with the following table:

AGRICULTURAL PRODUCTS FOR 1893.

Wheat	$21,000,000
Barley	7,000,000
Oats, corn, etc	1,500,000
Hops	1,000,000
Beans	2,000,000
Beet sugar	1,750,000
Hay	4,000,000
Wool	4,000,000
Potatoes	1,000,000
Vegetables	5,000,000
Nuts	500,000
Miscellaneous	1,000,000
Total	$49,750,000

We believe that the State has for a number of years encouraged the farming interest more than it has the mining interest, and that the various amounts appropriated by the Legislature of 1893 is a just criterion of its policy. The biennial appropriations are as follows:

State Agricultural Society	$40,000
Citrus fairs	40,000
Forty-Third District Agricultural Societies	200,000
State Board of Horticulture	29,600
State Board of Viticulture	30,000
Commission of Public Works	30,000
Total	$369,600

And amouuting to over five per cent of the gross productions of the agricultural, horticultural and viticultural productions. The miners justly think they have not received sufficient encouragement, as only $50,000 was appropriated by the same Legislature in their interest, and that for the Mining Bureau for two years being about 2½ per cent of the gross value of mineral productions; hence the farming interest received twice as much pro rata as the mining interest. I do not make this comparison for the purpose of antagonizing the farming industry, but to simply show that the mining industry has not been fostered in proportion to its importance.

If the Legislature had been as liberal with us as with the farmer, the $250,000 appropriation under the "Ford bill" would have been made available immediately. Had the impounding dams, etc., as contemplated by the said bill, been constructed, the yield of the precious metals for '93–4 would have been materially increased over and above the amounts contained in the following tables by counties for '92–3, as prepared from the data furnished by the Director of the U. S. Mint:

GOLD AND SILVER PRODUCT OF CALIFORNIA FOR 1892.

County.	Gold.	Silver.	Total.
Amador	$1,210,383 45	$8,007 99	$1,218,391 44
Butte	316,998 50	610 00	317,608 50

Yuba	30,839 27		30,839 27
Totals	$12,422,811 60	$537,157 77	$12,959,969 37

These tables show that the gold product of 1893 was $149,088.97 less than that of '92, and that the silver production of '93 was $274,607.31 more than that of '92, and the gross yield of the combined gold and silver was $125,518.34 more in 1893 than in '92.

The large increase of silver occurred in San Bernardino county, while Butte county also increased its silver production by about $5000; although its combined gold and silver product of '93 was nearly $5000 less than that of '92. In 1893 the increase and

decrease by counties of their gold and silver production is shown by the following table:

Name of County.	Increase.	Decrease.
Amador	$292,813 10	
Butte		$ 4,754 36
Calaveras	850,342 12	
Colusa		300 00
Del Norte	6,250 00

*Madera county formed from Fresno in February, 1896.
†No returns for 1893.

Under the Caminetti bill there have been some fifty odd permits granted to mine by the hydraulic method, and probably two-thirds of those granted permission are now in operation.

From the best information obtainable the production of gold in California for this year will be between thirteen and fourteen millions, and a decided increase over the production of 1893.

The oil industry is also beginning to assume considerable proportions, and during the past fifteen months some eighty wells have been bored in the city of Los Angeles upon two or three city blocks. The yield of these wells is now about 450 barrels daily and could be increased by more active pumping. About eighteen or twenty miles east of the city of Los Angeles are the Puente oil wells, which are now producing about 300 barrels per day, but which likewise could be increased should the demand warrant it. Between Newhall and Santa Paula large quantities of oil are being produced, but the amount of daily production is not now available.

Upon the request of the Chamber of Commerce of the city of Los Angeles, a representative of the State Mining Bureau is now investigating the oil formations of Los Angeles, Ventura and San Diego counties.

As a representative of the Mining Bureau, I will say that it desires to be in touch with the mining industry and to be of practical value to it. It has been deemed best to disseminate the information it gathers in connection with technical matters by means of bulletins or pamphlets, leaving the description of mines and the geological matters to be published in the report itself.

Of the bulletins we have already issued and distributed three, the first being Methods of Mine Timbering, by W. H. Storms; the second The Gas and Petroleum Yielding Formations of the Great Central Valley of California, by W. L. Watts, and the third Catalogue of Californian Fossils, by Dr. J. G. Cooper.

We have now in press a bulletin on the Cyanide Process, by Dr. A. Scheidel. It is the most exhaustive and best illustrated treatise on that subject ever written, and will be ready for distribution in about a month. This bulletin and the twelfth report will be mailed to the members of this convention who will leave their addresses with the secretary.

We have also in preparation, but not quite ready for the press, another bulletin entitled Gold Milling Practice in California. This describes the process employed in the mills in all parts of the State, and its perusal will enable the mill man in one part of the State, whose ores do not work satisfactorily, an opportunity of trying a process used in another portion of the State, whereby his ores may be beneficiated to better advantage. We also have in contemplation, by an eminent mechanical engineer, a bulletin on pumping machinery adapted to all kinds of mines and irrigation. We have also made arrangements to issue as early as possible in each year a bulletin showing the amount of all mineral products in California for the preceding year.

State Mineralogist's Report.

The twelfth report of J. J. Crawford, State Mineralogist, is issued, being the second biennial, for the two years ending Sept. 15, 1894.

The board of trustees bear testimony to the zeal, energy and fitness of Mr. Crawford and his assistants, particular and deserved mention being made of the secretary and custodian of the museum, Mr. H. S. Durden. The number of visitors registered from the date of the last report to July 31, '94, was 65,985. During that time 1038 new specimens were added.

One of the best rejoinders to those who ask "What good is the Bureau?" is found in the statement that, since the last report, answers have been sent by letter to 594 inquirers; 2070 specimens have been examined and passed upon, and 660 determinations have been made to men who have personally presented their specimens. This is but a fraction of the office work, and has nothing to do with the immense amount of intelligent information secured by field work, etc.

The "Mines and Mining Products of California" receive most extended notice. A good plan is adopted of segregating a description of the mineral products of each county in such a way as to make the volume of more than ordinary value for reference, and every mineral product of the State is given full and fair consideration. Of the 541 pages of the book, 252 are devoted to a description of the gold mines of the State, their names, their location, the names of the present owners, superintendents, etc., and other interesting matter of personal and permanent interest. The prominence of electric power in connection with mining is recognized by devoting forty-three pages to a practical illustration of "The Use of Electricity in Mining Operations." An elaborate compendium of statistics gives a correct epitome of the mineral products of the State for '93. Maps and illustrations give additional value to the volume, which throughout is deserving of commendation.

The publications of the State Mining Bureau are of recognized value the world over. In this regard it is in place to say that non-residents of the State applying for any of the Bureau's publications should remit enough in stamps to cover cost of postage. The postage on the 8th Report is 25 cents; on the 9th, 12 cents; on the 11th, 16, and on this one 16 cents. The publications of this Bureau are rightly accounted of permanent value. A set of the first ten of the Mineralogist's reports is now held at $50.

Address before the California Miners' Association

By S. B. Christy, Professor of Mining and Metallurgy, University of California, Nov. 20, 1894.

Mr. President and Miners of California: I have listened with the greatest interest and pleasure to the proceedings of this convention, and it seems to me that the keynote of all that has been said is the necessity for co-operation.

In 1776 when those brave men who drew up the Declaration of Independence had met for the last time to sign it, and the last pen stroke had been made, there was a moment of silence. John Hancock, turning to the assemblage, said: "Now, gentlemen, we must be unanimous; there must be no pulling different ways; we must all hang together." "Yes," added Benjamin Franklin, "we must all hang together, or we shall all hang separately." American history tells how nobly they hung together, and our common country is their monument.

But we Californians have not yet learned to hang together. Existence has been so easy with us that co-operation seemed unnecessary. But now, for the first time, the farmer finds no market for his wheat, the grapes hang ungathered upon the vine, the wine-press is untrodden, the forge, the cupola, and the lathe are idle and the wheels of commerce locked.

No single cause has contributed more to this result than the unfortunate conflict between the farmer in the valley and the miner in the mountains. This ill-managed contest has brought evil to the whole community. Invested millions have been rendered worthless, producing thousands have been driven from their labor, the nearest market for the valley farmer has been destroyed, and every interest of the State has suffered.

In this connection I wish to call your attention to some statistics which I have given more fully in the programme of this convention. There are only three producers of material wealth in any community—the farmer, the mechanic and the miner. All the rest of the community depend on them for their existence. According to the Tenth Census (the only one yet available), in 1880 each farmer produced a gross value of $289; each mechanic (deducting one-third for the value of the raw material) produced a value of $996, and each miner produced $1167. According to data furnished by the State Mineralogist for 1893, each California miner produced a value of $1434 as the result of his labor. Man for man the miner has created more material wealth as the result of his labor than any other member of the community.

The miner is too important a factor in our civilization to be ignored. His activity cannot be checked without throwing out of balance our whole industrial and commercial system.

Has not the time arrived for all who believe in the future of California to pull together? Is it not a common duty to bring to a peaceful issue this conflict between the farmer and the miner? A satisfactory solution of the problem is difficult. But it would be a libel on the engineering ability of our people to say that it is impossible.

For, I am firmly convinced that if this problem is attacked in the right spirit, it will be found practicable to extract the wealth of the mountains, not only without injury to the farmer, but to his lasting benefit; no longer inundating him with debris, but reclaiming the swamps and tule lands from malaria; the mountain streams will be no longer a menace to his existence, but, irrigating and fertilizing his land, they will be welcomed like the waters of the Nile, till at last the great valley of California shall support a population greater than that of ancient Egypt. And, when the last ounce of gold shall have been extracted from the mountains, the hydraulic miner will leave behind him water-power facilities that will people the mountain valleys with a manufacturing population greater than that of New England. And, relieved not only from mining debris, but also from the disturbing effects of natural detritus, the rivers of California will be maintained for all time the natural highways of commerce.

Such results as these are worth striving for, not only by the State, but by the National Government. If, in the interests of commerce, Congress is justified in improving the navigation of the Mississippi river, why should it not do as much for California? The War Department employs an able Corps of Engineers to protect the country in time of war. What better service could they render their country in time of peace than to solve such a problem as this?

Removed by their position and the traditions of their profession from the least suspicion of self-interest, their solution would be received with confidence by all classes of the community, and it would be possible to accomplish under the authority of the Government what would be impossible to any one else.

The United States Geological Survey might also be of service in this matter. This body employs trained geologists, some of whom have devoted their lives to the study of the eroding and carrying power of rivers and mountain streams. This knowledge of natural laws, based on observations all over the world, would be of great service in solving the problem which has become so important to California industries.

There is no citizen of the State or Nation, miner, farmer, merchant, manufacturer or common laborer, who is not interested in seeing the gold extracted from the Sierras without injury to any other interest. And he who, whether by the arts of the agitator and the demagogue, or by clandestine evasion of the law, renders a peaceful solution of this question more difficult is a public enemy and should be treated accordingly.

I have been invited to say a few words about the Mining Department of our University, though the lateness of the hour warns me that I must be brief. The University of California is a combination of colleges. The organic act incorporating the University, now embodied in the State Constitution, provides that "There shall be organized, in the order mentioned, a College of Agriculture, a College of Mechanics, a College of Mining, a College of Civil Engineering, a College of Letters, and such other colleges as the Board of Regents may hereafter provide." Since then Colleges of Law, Medicine and Art have been added. But those who founded the University of California founded it on the industrial idea, putting the great industrial arts, agriculture, mechanics and mining on an equality with the time-honored liberal arts of the schoolmen. Not only this, but they provided free instruction for all who are able to benefit by it.

A mining school can have no reason for its existence unless it can teach the miner something he cannot learn so well in the mines. The question arises: "Are there such things?" It seems to me there are several. In the first place, every one will admit that the miner should be able to recognize a bonanza when he finds it. There are many instances which show he is not always able to do it.

In Shasta county, not very long ago, probably some of you remember the case of the miner who struck a rich pocket of free gold, and for a long time pounded out these rich specimens in a hand-mortar, being very much annoyed by a dark shining mineral, which he threw over the dump because it would not amalgamate. Finally an old Colorado miner, who was better posted, happened along, and informed him that it was rich telluride of gold he had been throwing over the dump!

But even the Colorado miners miss a bonanza sometimes. Sluicing for gold in the so-called "California Gulch" for a long time, they were annoyed by a heavy gray mineral which choked up the sluices and would not amalgamate. It was a long time before they found out that it was carbonate of lead carrying chloride of silver, and the discovery of the rich silver-lead deposits of Leadville followed.

The Nevada miner has had the same experience. Again sluicing for gold, he was troubled by a bluish-gray mineral which would not amalgamate and was vigorously denounced as a nuisance, until a Truckee farmer took a specimen to Nevada City for assay, and the discovery of the Comstock lode followed.

These cases might be multiplied, but who can tell how many undiscovered bonanzas have been missed by the hardy prospector because the value lay hidden in an unfamiliar form? On the other hand, how many men have spent thousands of dollars prospecting for coal in lava beds, when a little geological training would have saved that waste?

There are many illustrations of the need of the power to determine the value of ores. It is not always possible to wash out a prospect in the miners' horn or pan. There is other gold than free gold which does not make a showing under this test.

Not many years ago I had occasion to ask a member of this convention for permission to investigate

the work done in reducing his ore. He owned the mine himself and thought he was extracting ninety-five per cent, and so did not think it worth while employing an assayer. To make a long story short, we found he was losing twenty-five per cent of the value up the chimney and another twenty-five was lost in the tails, and he was extracting just fifty per cent. We demonstrated this loss to his satisfaction and the mode of treatment was speedily altered.

Another case was brought to my notice by an engineering friend, where one of the largest mines in this country claimed to be extracting ninety-eight per cent, and he found they were extracting just sixty per cent. Numerous changes were made, and not long since a careful examination convinced me that they are now extracting ninety per cent.

It would be easy to multiply such instances, but is hardly necessary, for it must be admitted that a well-equipped mining school, with minerals, ores and rocks culled from a thousand mines all over the world, with laboratories for the study of chemistry, physics, assaying, metallurgy and ore-dressing, with shops for the study of mechanics and electricity, and a complete equipment of instruments for instruction in surveying, can teach the miner many things he needs to know that he cannot learn so well at the mine itself.

But there are also things that the student cannot learn at the mining school. These are the actual conditions which the miner is forced to meet—the multitudinous details that are only to be learned by actual contact with the things themselves. It is of this I particularly wish to speak, in order to secure your co-operation in making our work practically successful.

Since the last meeting of this convention a large committee of our engineering faculty spent six months, meeting twice a week, and considering every point, for the purpose of reorganizing our whole course of instruction. Every subject not fundamentally essential to the course has been eliminated. The leading idea has been to arrange all the remaining subjects so as to make them most effective. With this in view, every subject taught is illustrated from the very beginning by practical exercises in the laboratory, the drawing-room and the field. In this way only, it is believed, can he secured either that firm grasp of principles or that readiness in their application so essential to the successful engineer. In the next place the summer vacations of three months each have been utilized to secure, at the mines themselves, an introduction to the practical work which must he met after graduation.

In Europe, where the mines, as well as the mining schools, are under government control, it is a simple matter to secure facilities for such practical instruction. Here we must depend entirely for this result on your good will and co-operation. The University of California is not an institution for rich men's sons. A large majority of our students contribute, at least in part, to their support, and among them are to be found the most successful men we have. Consequently, when we attempted to introduce this new feature, involving additional expenses, many of our students were unable to meet them. Last summer two of them came to me explaining their situation, but said they were willing to work if they could thus earn their expenses. I gave them a letter to Col. Alvinza Hayward explaining the facts, and he put them at work in the Utica mine. They were paid regular miners' wages, and Supt. Lane of the Utica informed me to-day that they earned every cent they were paid, and he would be glad to have more men of the same sort. I wish to ask the co-operation of every mining man in the State to help in making this feature of our instruction a success.

And there is another thing I wish to ask of you, and that is to send us the best material—your own sons—to be educated as mining engineers, and then I am sure you will help us to make them successful. One of the great difficulties that meets the young man in the mountains is the lack of preparation necessary to enter college. To overcome this difficulty our faculty has been laboring for years to increase the number and the efficiency of our High Schools. Those whose work is found to be satisfactory are put on what is called the "approved list of High Schools." The graduates from such schools are admitted to the University without further examination, on recommendation of the principal.*

I have shown elsewhere that each mining engineer in the United States superintends and controls a production of $100,000 a year. During his working life of thirty years, this amounts to a gross output of $3,000,000 for each mining engineer in the country.

Surely it is not a bad investment for a young man to spend four, five or even more years in fitting himself for a position of such responsibility. Particularly is this true in California, where the State offers its instruction free to all who are able to benefit by it.

There is no profession where practical experience is more essential than in mining. But the necessity of sound training is too often lost sight of. A hard-headed Arizona miner once put the matter very tersely when the superiority of the "practical man" was being strongly urged, by saying: "I have had thirty years' practical experience in mining, and I would give twenty-five of those years to have had a good technical education to begin with." He was clearly right, for a man well trained in fundamentals has a broader grasp and can more intelligently and rapidly utilize his experience than a man without this training.

Either theory or practice, alone, is helpless; united they are invincible. No better instance can be given of the value of combined scientific and practical training than the wonderful development of the mines of South Africa. All the world has been astonished at the rapidity with which they have sprung into prominence, but few have reflected upon the reason of this rapid development. The miners were nearly all negroes, hardly escaped from barbarism; but the work was largely managed, almost from the first, by educated mining engineers, many of them from California.

The diamond mines at Kimberley are contained in what was once the throat of a mud volcano. It was worked at first as an open cut, till, as they got deeper, they were being continually overwhelmed by slides from the caving walls. At this time the mines were visited by Gardiner F. Williams, a graduate of the University of Californuia, who had afterwards studied in Europe and worked at drift mining in California. He soon came to the opinion that their method of mining was faulty and they could work more cheaply and safely by adopting methods similar to what he had seen in the drift mines of Californuia. His views reached the ears of the directors, who were in despair at the lack of dividends. Mr. Williams was finally made manager of this great property and soon made a practical demonstration of the correctness of his views. His company now commands the diamond market of the world.*

Mr. Heunan Jennings, a graduate of the Lawrence Scientific School, who got his practical mining experience at New Almaden, North Bloomfield and the Ruby drift mine in Californuia, is another who has largely contributed to opening up the gold mines of Johannesburg. I recently had the pleasure of looking over a large album of views in the mines in which he had been consulting engineer, and those who are familiar with our best equipped plants would be astonished to see how far South Africa has leaped ahead of what is usual in California. They have been executed by California men, as the result of California experience, and they have often improved upon their model, because they have been allowed to carry out their ideas to their legitimate conclusion.

After many previous failures, it was reserved for another graduate of the University of California—Mr. Charles Butters—to make the first working success with the chlorination process in South Africa. Having accomplished this, he erected there the first successful cyanide reduction works in the world, and I heard from him only yesterday that he was getting good results in the electrical precipitation of gold by the Siemens and Halske method.

But there is still another lesson to be learned from this South African experience, and with this I must close. Governor Markham has truly said that if any other country in the civilized world had the hydraulic mines of California, they would have found a way to allow the miner to work them. England has no gold mines of her own, but she has shown energy enough in opening those in the heart of Africa. And while Californians were busily eugaged in discouraging California miners; while the California farmer was trying hard to kill the goose that lays the golden egg, England has carefully culled from the most energetic and experienced of our miners, men like Hamilton Smith, Henry C. Perkins, Capt. Thomas Mien, and many others, and has set them to extracting what is now British instead of what might have been California gold.

In 1888 this South African product amounted to over four million dollars, and the product has steadily increased until in 1893 it amounted to nearly twenty-seven million dollars, and in the six years it has reached the sum of over eighty-one million dollars. There is an eloquence in these figures that should appeal to all Californians.

*It may be interesting to add that Mr. Williams has sent his own son to study mining at the University of California.

*As it may prove of service, the following list for 1894 of approved High Schools and academies from which graduates are admitted without examination, on recommendation of their principals, to the College of Mining is appended: Alameda, Armijo, Bakersfield, Belmont School, Berkeley, Boone's University School, Centerville, Coronado, Fresno, Grass Valley, Haywards, Healdsburg, Hoitts' Oak Grove School, Lompoc, Los Angeles, Marysville, Mt. Tamalpais Military Academy, Nevada City (in part), Oakland, Oak Mound School, Napa, Pasadena, Petaluma, Pomona, Redlands, Riverside, Sacramento, Salinas, San Bernardino Academy (in part), San Diego, San Francisco Boys' High School, San Jose, San Rafael, Santa Ana, Santa Barbara High School, Santa Barbara College, Santa Cruz, Santa Monica, Santa Rosa, Sonoma Valley Union, St. Matthews' School, Stockton, Trinity School (in part), Vallejo, Ventura, Visalia, Watsonville.

Personal.

M. D. HOWELL has succeeded E. W. Roberts as superintendent at the Carson Creek mine, Calaveras Co.

E. H. BENJAMIN, one of tbe delegates of the State Miners' Association to the Trans-Mississippi Congress, held at St. Louis, has returned.

TIREY L. FORD and Charles G. Yale of San Francisco and J. L. Fulweiler of Placer county are the appointed delegates to attend the meeting of the River and Harbor Improvement Committee, to be held in Sacramento.

Concentrates.

THE majority of the deep quartz and drift mines in Sierra Co. are run by electricity.

GOLD is reported discovered in the gravel and black sand of Russian river, near Duncan's Mills.

THE Gracie Consolidated claims at Gold Flat, Nevada Co., have been sold by G. W. Baldwin to Geo. Senn for $25,000.

ARRANGEMENTS are being made to light Angels and the mines, also the towns of Murpbys and Altaville, by electricity.

AT the Helena, Montana, assay office it is estimated that the receipts for 1894 will reach $2,000,000, as against $1,300,000 in 1893.

OVER $60,000 has been expended this summer on the Unga island, Alaska, mines, in putting in a 30-stamp mill and chlorination works.

THE Marotte mines, in Jackson Co., Or., owned by the Detroit Mining Company, of Detroit, Mich., have a ten-stamp mill upon the ground.

WIGGINS & WILSON, of Kennedy, last week shipped from there forty tons of high grade gold ore from the Hidden Treasure mine to the Selby Smelting and Lead Co.

THE Ora Dell group in southern Oregon, owned by the Ora Dell Mining Company of Chicago, are now putting up a mill on tbeir property.

THE Virtue gold mine, near Baker City, Or., employs seventy men and keeps a twenty-stamp mill going. The profit is $18,000 per month.

THE Mary Ainsworth mine, Josephine Co., Or., owned by Clough & Wright, is equipped with an arrastra. The three first sixteen tons of ore gave $526.

ABOUT 100 tons of ore from the Succor mine are being worked in the Taylor mill in Silver City, Nev.; it is expected that the cleanup will net the owners of tbe ore about $10,000.

THE report of the Administrator of British New Guinea shows considerable falling off in the export of gold from that province. Tbe output was 3850 ounces in 1888-9; it was 582 ounces in 1892-3.

THE Standard Gravel Mining Company has incorporated in tbis city with a capital of $240,000, fully subscribed. Directors—Mikal Olsen, Thomas Thomson, E. R. Knippenberg, W. E. Hargers, Henry Gerdan.

IT is becoming a question in tbe Slocan what to do with the carbonates found in many of tbe claims. They are not rich enough to ship, running about eighty ounces, but still have to be mined and taken out of the way.

UP to the passage of the silver bill the Anaconda mine was turning out silver and copper. It is now turning out gold and copper. A similar change in the complexion of other mines would be of present satisfaction to their owners.

WORK will be begun next spring near Rainbow falls, Montana, on large copper refining works. In the erection of tbese works it is the intention of the Anaconda Company to make them of sufficient capacity to treat the entire output of their mines.

JAMES MOORE has forty men at work on his property near Radersburg, Montana, the payroll amounting to about $3500 monthly. The mine is a free-milling gold-ore proposition, and it is understood that a large stamp-mill is soon to be erected to work the ores.

THE Denver *Record* declares that in Cripple Creek a prospector cannot miss it. All he has to do is to throw his hat in the air and sink a shaft where it lights. It was in just some such fashion as this that nearly all tbe big properties of tbe camp were located.

THE New Mexico Electro-Chemical Reduction Company has incorporated in Cbicago, Ill., to mine, reduce, refine and treat ores, minerals bearing gold, silver or other precious metals. Capital stock, $100,000. Promoters: Otto R. Barnett, Glenn C. Plumb, Clark Edw. Ridpath.

THE Salt Lake copper plant is in the possession of A. Hanauer by reason of the failure of the company to pay interest on $100,000. The entire debt of $227,200 fell due on last Monday. Tbe property is to be sold at sheriff's sale Jan. 14, '95. It is understood it will be bougbt in by a syndicate of creditors.

MARCUS DALY says that during the existence of the Anaconda Company it had expended $44,050,000 in the upbuilding of Montana; that in two years Great Falls would be shipping steel rails East and sheet copper to India, and while he was manager of the Anaconda Company miners' wages would not be reduced.

ON the 24th inst., the Hecla Consolidated Mining Company of Glendale, Montana, paid three dividends, Nos. 132, 133 and 134, of $15,000 each—the usual monthly dividend of 1 per cent, a Christmas present of $15,000 and a New Years gift of a like sum. This makes the total sum of cash dividends paid by this company to its stockholders $2,010,000.

WORK goes on on the big McCune drain tunnel in the Park City, Utah, mining district. A penetration has been made of 2000 feet. The entire length proposed will drain all the properties that run along the veins south of the parallel to the Ontario tunnel, including the Wasatch and McHenery mining groups. The tunnel may be almost as useful as the Ontario eventually.

A DENVER dispatch says the recent gold strikes in Leadville are causing excitement. Tbe railroads can hardly carry the people. Gold strikes have been numerous in Leadville for the past two years, but none have attracted so much attention as the two latest in the Rex and Triumph mines, which go to establish the fact that the gold belt extends at least tbree miles, the two discoveries being that far apart.

As a consequence of Government intervention an arrangement has been arrived at between the African Gold Recovery Company and those who had called in question the validity of the company's patents, consisting in judgment being entered for the company in the litigation that has been proceeding, thus establishing the validity of the cyanide patents in the South African Republic, and the company, in consideration of the term of its patents being extended for five years, agrees that the royalty for their use shall be reduced to 3½ per cent in the Transvaal. As the patents had still about eight years to run, this means that they will continue to bold good for thirteen years from now.

The Electro-Metallurgy of Gold and Silver.

Read before the Engineers' Club, of Philadelphia, by A. L. Ellonhead.

I hope the following will be of interest to some of the members of this club and to others who are interested in the utilization of electricity in the cheaper methods of extracting gold and silver from their ores.

Those who are familiar with the cyanide process know of the difficulties one contends with in using shavings or zinc in any other form to precipitate the gold and silver from cyanide solutions; such as the dissolving of the zinc as the solution passes over it, and after a short time rendering the solution inert for the dissolving of gold and silver, which makes necessary the running to waste of large quantities of solution, which contain considerable free cyanide of potassium, gold and silver.

There are certain unaccountable reactions that occur which prevent the total precipitation of the precious metals from the solution when using zinc shavings as the precipitant.

Large losses occur in collecting, drying and smelting the resultant "zinc slimes," or precipitate, which we all know is not a homogeneous mass, and great care is necessary in sampling it for assay. The resultant bullion is sold in South Africa for about ten shillings ($2.40) less per ounce than for the bullion received from the amalgamated plates of the stamp mills.

There has been erected a small plant for working what is known as the electro-chemical process (patent applied for) on the west side mine of the Tombstone Mill and Mining Company, of Tombstone, Arizona.

The process overcomes the above difficulties encountered in precipitation, in which electricity enters as a factor and the resultant precipitate is recovered in the shape of gold and silver amalgam.

Electricity is being utilized more and more every day in chemical and metallurgical operations, and it is not surprising that an important discovery has been recently made, in which it has been found that the precious metals can be precipitated on a large working basis when they are in solution with certain chemicals, such as the cyanides, with the aid of electricity for the electrolysis of certain saturated solutions of the alkaline metals or earths.

A description of the process is as follows: The ore was crushed to a certain fineness, depending on the character of the gangue. It is then placed in leaching vats, with false bottoms for filtration, the same as other leaching plants. A solution of cyanide of potassium and other chemicals of known percentage is run over the pulp and left to stand a certain number of hours, depending on the amount of metal to be extracted. It is then drained off and another charge of the same solution is used, but of less strength, which is also drained. The pulp is now washed with clean water, which leaches all the gold and silver out and leaves the tailings ready for discharge, either in cars or sluiced away by water, if it is plentiful.

The chemical reaction of cyanide of potassium with gold is as follows, according to Elsner:

$$2Au+4KCy+O+H_2O=2KAuCy_2+2KHO.$$

That is, a double cyanide of gold and potassium is formed.

All filtered solutions and washings from the leaching vats being saved and passed through a precipitating "box" of novel construction, which may consist either of glass, iron or wood, and made in any shape, either oval, round or rectangular—if the latter, it will be about ten feet long, four feet wide and one foot high—and is partitioned off into five lengthwise compartments. Under each partition, on the inside or bottom of the "box," grooves may be cut a quarter to a half inch deep, extending parallel with the partitions, to serve as a reservoir for the amalgam, and give a rolling motion to the solution as it passes along and through the four compartments. The center compartment is used to hold the lead or other suitable anode and electrolyte.

The anode is supported on a movable frame or bracket, so it may be moved either up or down as desired, it being worked by thumb screws at each end.

The electrolyte may consist of saturated solutions of soluble alkaline metals and earths. The sides or partitions of each compartment dip into the mercury, which must cover the "box" evenly on the bottom to the depth of about a half inch.

Amalgamated copper strips or disks are placed in contact with the mercury and extend above it, to allow the gold and silver solution of cyanide to come in contact.

The electrodes are connected with the dynamo; the anode of lead being positive and the cathode of mercury being negative. The dynamo is started, and a current of high amperage and low voltage is generated, generally 100 to 125 amperes, and with sufficient pressure to decompose the electrolyte between the anode and the cathode.

As the gas is generated at the anode, a commotion is created in the liquid, which brings fresh and saturated solution of electrolyte between the electrodes for electrolysis, and makes it continuous in its action.

The solution of double cyanide of gold, silver and potassium, which has been drained from the leaching vats, is passed over the mercury in the precipitating "box" when the decomposition of the electrolyte by the electric current is being accomplished, the gold and silver are set free and unite with the mercury, and are also deposited on the plates or disks of copper, forming amalgam, which is collected and made marketable by the well-known and tried methods. The above solution is regenerated with cyanide of potassium by the setting free of the metals in the passage over the "box."

In using this solution again for a fresh charge of pulp, it is reinforced to the desired percentage, or strengthened with cyanide of potassium and other chemicals, and is always in good condition for continuing the operation of dissolving.

The chemical reaction of forming cyanide of potassium in the precipitating "box" is as follows, per Elsner:

$$2K+2H_2O=2KOH+H_2$$
$$1(AuKCy_2)+H_2=2KCy+2HCy+2Au$$
$$2HCy+2KOH=2KCY+2H_2O$$

Which is explained thus: The potassium acting on the water of the solution creates nascent hydrogen and potassium hydrate; the nascent hydrogen sets free the metals (gold and silver), which are precipitated into the mercury and form amalgam, leaving hydrocyanic acid; this latter combines with the potassium hydrate of the former reaction, thus forming cyanide of potassium. There are other reactions for which I have not at present the chemical formulas.

As the solution passes over the mercury the center compartment of the "box" is moved slowly longitudinally, which spreads the mercury, the solution is agitated and comes in perfect contact with the mercury, as well as the amalgamated plates or disks of copper, insuring a perfect precipitation.

It is not always necessary to precipitate all of the gold and silver from the solution, for it is used over and over again indefinitely; but when it is required, it can be done perfectly and cheaply in a very short time.

No solution leached from the pulp, containing cyanide of potassium, gold and silver, need be run to waste, which is in itself an enormous saving over the use of zinc shavings when handling large quantities of pulp and solution.

Some of the advantages the electro-chemical process has over other cyanide processes are: Its cleanliness, quickness of action, cheapness, and large saving of cyanide of potassium by regeneration; not wasting the solutions, larger recovery of the gold and silver from the solutions; the cost of recovery less, the loss of gold, silver and cyanide of potassium reduced to a minimum; the use of caustic alkali in such quantity as may be desired, to keep the cyanide solution from being destroyed by the acidity of the pulp and also sometimes to give warmth, as a warm cyanide solution will dissolve gold and silver quicker than a cold one. These caustic alkalies do not interfere with or prevent the perfect precipitation of the metals. The bullion recovered in this process is very fine, while the zinc-precipitated bullion is only about 700 fine.

The gold and silver is dissolved and then precipitated in one operation, which we know cannot be done in the "chlorination process;" besides, the cost of plant and treatment is much less in the above-described process.

The electro-chemical process, which I have hastily sketched, will, I think, be the future cheap method of recovering fine or flour gold from our mines and waste tailing or ore dumps.

Without going into details of cost of treatment, I will state that with a plant of a capacity of handling 10,000 tons of pulp per month, the cost should not exceed $2 per ton, but that may be cheapened by labor-saving devices. There being no expensive machinery, a plant could be very cheaply erected wherever necessary.

Sir Humphrey Davy first electro-deposited the metal sodium in the year 1807, and deposited it easily into mercury, forming an amalgam by a crude though effective method. He first made a cup-shaped receptacle of moistened carbonate of soda, placed it upon a platinum plate, the cup was filled with mercury and made the cathode, and the platinum plate the anode; then, with a current of electricity from a powerful battery, the metal sodium was deposited into the mercury, thus forming an amalgam. Also, in the year 1837, in the Philosophical Transactions of the Royal Society, it is stated that Dr. Golding Bird, in 1837, decomposed, by means of a voltaic current, solutions of the chlorides of sodium, potassium and ammonium, depositing their respective metals on a negative pole of mercury, and thus obtained their amalgams.

It has been traced back to the year 1840 that Mr. John Wright dissolved gold and silver in cyanide of potassium solution successfully. A patent was taken out March 24, 1840, by Messrs. G. R. and H. Elkington, of London, who incorporated in their patent the above discovery of Mr. Wright for the use of soluble alkaline cyanides in any strength solutions required for dissolving metallic gold, silver or any other metal; also any compound of these metals in a finely divided condition, such as a chloride precipitate, etc. The use of cyanide of potassium, or any of the soluble alkaline earths, for dissolving metals, has become public property since the expiration of the above patent of Messrs. Elkington.

I call attention specially to the above facts to show that the ideas of using electricity for the making of alkaline metal amalgams, and the use of cyanide of potassium in particular for dissolving metals, were both well known years ago.

In the year 1837 electro-metallurgy was brought into prominence by the many experiments made upon the deposition of different metals, but it was not until recent years that the ideas then advanced were put into practical shape and successful operation. Modern mechanical devices and the powerful electric dynamo have made possible the rapid strides in electro-metallurgy.

In the electro-chemical process, which I have described above, the ideas of Sir Humphrey Davy and Mr. John Wright have been utilized to a certain extent in making sodium and potassium amalgams by the electric current, and the dissolving of metals with the cyanides; but the construction of the precipitating "box" used in the described process, whereby the gold and silver only may be extracted perfectly from an old plating solution of cyanide, or from a cyanide solution leached from gold and silver ores, is new.

It is well known to chemists that the silver of an old cyanide plating solution cannot be satisfactorily converted into pure chloride by adding an excess of hydrochloric acid and boiling the mixture. The precipitate so obtained is of different colors and contains foreign substances, while with the electro-chemical process the gold and silver only were precipitated, as was clearly shown by the assay of the resultant bullion, which was 990 fine. The cyanide solution tested contained large percentages of copper, lead, zinc and iron, with small percentages of manganese, carbonate of lime, etc., which were left in the solution, not being precipitated with the gold and silver. Surely, a more severe test could not have been taken for the demonstration of the advantages of the process.

It may be suggested, since the above metals were in combination, as the double cyanide with potassium and sodium, that the gold and silver are electro-negative to hydrogenium-potassium, or hydrogenium-sodium amalgams, depending on the electrolyte decomposed. Water requires about 1.5 volts to decompose it by an electric current; caustic soda requires over two volts, yet if mercury is present to absorb the sodium as it is set free and protect it from the water, we shall obtain sodium amalgam, while the water is decomposed, at the same time forming hydrogenium amalgam. These amalgams thus formed in the precipitating "box" coming into contact with the solution of the double cyanide of gold and silver, aid the setting of them (gold and silver) free; the mercury immediately absorbs them and forms the amalgam, which is easily collected, retorted and smelted into bullion. There may be other theories advanced by those more familiar with the subject, but the results obtained are more than flattering.

In examining the recovered gold and silver amalgam after a "cleanup," there were discovered through it hard lumps or nodules, some crystalline in form, having a bright metallic appearance, different from the surrounding mass. I would be pleased to know if any one can give an explanation of the formation of the above forms, as it presents a curious phenomenon.

The above process will be worked by the Electro-Chemical Reduction Company on a large scale in different gold and silver-bearing countries.

The process is not adapted to all refractory ores. Some need a previous treatment, as was the case with the ores tested from the Lucky Cuss mine, at Tombstone, Arizona. The ore contained silver, gold and about 35 per cent of manganese. By the simple process of leaching only three per cent of the bullion was recovered; but by first roasting with ten per cent of common salt, and then by the electro-chemical process, over ninety-two per cent of the bullion was extracted. Fuel is a great factor to be taken into consideration. At Tombstone wood costs, delivered, $9 per cord, which makes it out of the question to treat their low-grade manganese ores. In other localities, where gold is found in a finely divided or flour condition, the cost of working this process is the cheapest known, taking into consideration the amount of bullion recovered.

In the chlorination process, if ninety-five per cent is recovered from the concentrates, containing, say, six ounces of gold, there is lost 0.3 ounces, or six pennyweights, in the tailings. In the electro-chemical process pulp containing but 0.5 ounces gold is treated, and eighty-five per cent or more of the assay value is recovered; and there is lost about 0.075 ounces, or 1.5 pennyweights, of gold in the tailings. The advantage of the latter process is obvious, even if the cost of treatment were the same, which is not the case.

The possibilities of the electro-chemical process are unlimited, as the precipitating "box" may be used to extract gold and silver from the ores direct, or from other solutions than the above-mentioned cyanides.

Mining Industry.

Written for the Amador *Record* by A. Thurston Heyden.

Some prospectors think that they are never prospecting unless tbey are rampaging around in inaccessible wilds where, if they fonnd a ledge of solid gold a mile long, four feet wide aud reacbing to the foundations of China, it would not reimbnrse a company for the expense incurred in bnildiug a road to it. While it is necessary for a certain amount of advance work to be continually done, and while it is conceded that some prospectors are eminently qualified to spend their lives in a wilderuess, where seveuleagued boots and a pair of wings are essential to locomotion (as they are of no mortal use auywhere else), still these advance agents of the great mining drama are not the ones that profit by tbeir finds. Nor, taking the other extreme, are the antiquated specimens who persist in burrowing arouud worked-out camps financially successful. The successful prospectors are fonnd among those between the two extremes. They are the energetic, wide-awake men who go to new, or comparatively new, mining districts, either within a reasonable distance of present transportation, or so situated as to be easy of access in case of valuable strikes, and examine the ground and test the ledges thoroughly as they go, selecting the best and staying with them until they have ascertained their real value.

This thing of goiug into a district aud putting locatiou notices on everytbing iu sight, besides on a good deal, tbat is out of sight, and theu sitting around some one else's fire, to save cutting wood, and borrowing chews of tobacco while waiting for some industrious miner to strike it rich and thns make their claims valnable, or for a wealthy compauy to come along and give them a million dollars for ten cents' worth of prospecting is played out. There are too many single-hand clam diggers and double-hand potato miners gophering aronnd in the mountains uow. It makes the toe of one's boot ache to go aronnd would-be mining camps and see the pitifully sballow coyote holes—dignified by the names of shafts and tunnels—the miserable apologies for assessments which are unblnshingly sworn to, and then to find the owners of said woe-begone improvements squirting tobacco juice upon a saloon stove and prevaricating about the size and richness of their ledges and the Lost Cabiu mines, whose whereabouts are known to them alone.

Such prospectors and miuers are a detriment to every camp they infest. The Sierras have their share of them, and there is no room, eitber here or anywhere else, for that worthless breed. There are too mauy of this kiud on hand now, but there is room, aud a welcome, for every energetic, wide-awake person who will come and aid in the development of the conntry, instead of loafing around waiting for others to put money into his pocket.

The questions might be asked: "But what are the inducements to go prospecting in the Sierras?" "Have they not beeu contiuuously prospected ever since the days of '49?" "Has not everythiug of any value been taken up?"

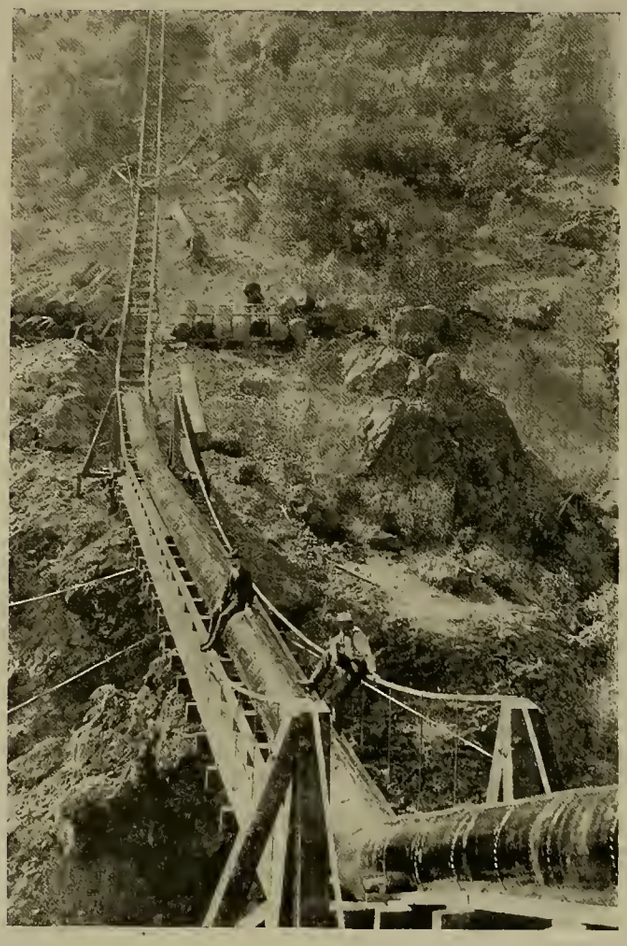
To these queries the following replies can be safely made: The inducements are mineral belts unsurpassed in mining history; accessibility, timber and water, and a large scope of practically unprospected couutry. The Sierras have been prospected ever since the days of '49, and the new strikes which are constantly being made but prove the superficial character of the prospecting which has been done. The tronble has beeu that the great mass of prospectors neither knew what they saw nor where to look. Considering the fact that mineral is found in the Sierras from 500 to 10,500 feet above sea level, and that there are millions of acres which have never had a notice of any description upon them, it is simply impossible that everything of value is taken up. Another advantage of prospecting in the Sierras is the great variety and value of their mineral resources. Building stone, precious stones, graphite, clays, silver, gold, antimony, lead and copper abound, to say nothing of placer deposits and the channels of ancicut rivers, with their rich leads of gold-bearing gravel. The eastern slope of the Sierras runs the best in silver, the western the best in gold—timber and water beiug more plentifnl upon the western slope, as well as its greater accessibility renders it the most favorable side for prospecting and operating mines.

Disguised as a Calf.

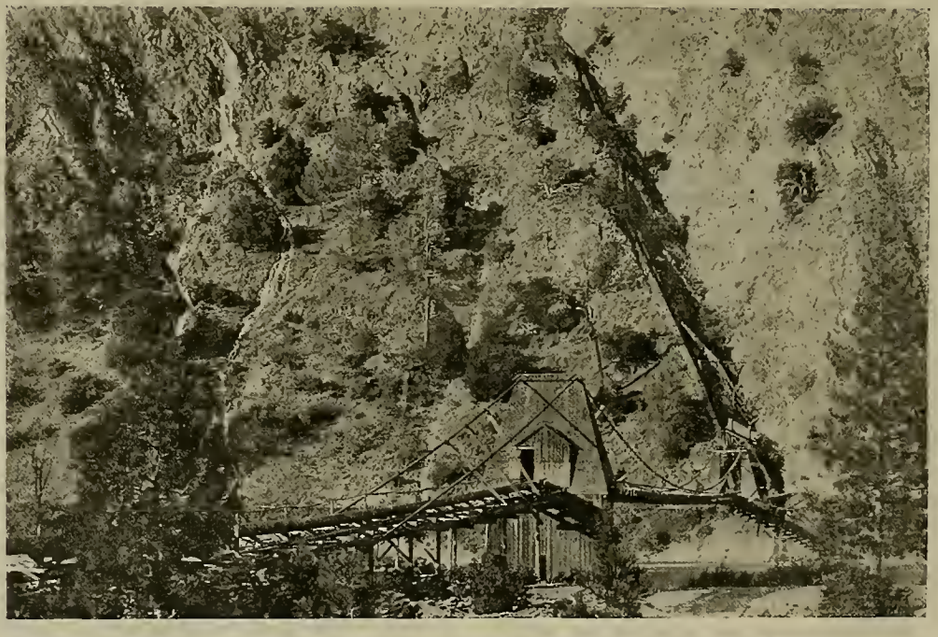
A miner operating on Sabe creek, Idaho, for some time past has missed a great deal of amalgam from his slnice-boxes. He determined to keep watch for the thief and several uights ago he saw a calf nibbling grass near the boxes, often reaching over the rim and drinkiug the water that flowed over the riffles. He, however, paid no attention to the animal. The theft of amalgam still coutinued, and a few nights ago when the calf appeared he shot it. He ran to where the calf was lying and saw a human leg with the foot wrapped in sacks protruding from the animal's stomach. It took him but a second to realize that he had shot the thief, who had been cleverly disguised as a calf. The miner took the culprit to camp, and much to his surprise he discovered the thief was a young woman.

Pipe in the Foothills.

We are in receipt of a series of illnstrations from the firm of Schaw, Ingram, Batcher & Co., of Sacramento, Cal., manufacturers of sheet steel and iron pipe, which, apart from the portrayal of tbe industry they represent, are good pictnres of Califoruia foothill scenery, tbus combining the useful and artistic in an eminent degree. The copper half-tones depict graphically the manner of overcoming natural obstacles in securing abundant flow of water in many parts of California. Yuba, Placer aud Trinity counties share in the portraiture of ways and means successfully devised to carry water across canyons, around cliffs aud up steep bluffs, and in this regard the work of tbe engraver is so well done as to leave little necessary for the pen to indite.



PIPE MADE AND LAID BY SCHWAB, INGRAM, BATCHER & CO. FOR THE BROWN'S VALLEY IRRIGATION DISTRICT, YUBA CO.



PART OF A PIPE FOR THE CIE. FSE. DES PLACERS HYDRAULIQUES IN TRINITY CO., CAL.
A portion of this pipe is being laid over a rocky bluff, 800 feet incline, and in a perpendicular rise 530 feet.

The Water Power of Niagara.

Engineers have estimated tbat the total water power of Niagara Falls is 7,000,000 H. P. This estimate, to be sure, is in the main only a guess, but when the area drained into the lakes above Lake Outario, and passing tbrough the Niagara river, be considered, the guess or estimate does not seem to be too large. The water surface of the great lakes above Ontario is 84,000 square miles, and the watershed of these lakes is 240,000 square miles—more tban twice tbe area of Great Britain and Ireland. The total length of shore line is 5000 miles, while the volume of water is 6000 cubic miles, of which Lake Superior contains almost one-half. The rate of outflow at Buffalo is from 217,000 to 275,000 cubic feet per second, while tbe fall of tbe cataract is 165 feet. The volume of water in the lakes is sueb that it bas been estimated that even if no rain fell the flow of the river would be contiuued at its present rate for 100 years—that is, if the lakes could be gradually drained. These are very large figures, says *Harper's Weekly*, but in the main they are the results of exact measurements. The small water powers in the world are uneven, and are afflicted by floods aud droughts, but tbis great power at Niagara is as constant as anythiug in this world can be, not even the ice in tbe severest and longest winter ever known appreciably cbanging it. The present plant is intended only to utilize 125,000 H. P. and the turbines now in place are only for a small part of this. Other turbiue wheels will be put in place as the demand for power grows. The general plan of the company contemplates tbe ultimate use of 450,000 H. P. on the American side and a like amount in Canada. Such a power would turn all the wheels within a radius of 500 miles of the falls. At the present time a considerable part of tbe power developed is to be taken to Buffalo by electric transmission, and it is the confident expectation of the electricians now at work on the problem that the power can be taken a far east as Albany, 300 miles away, and delivered there cheaper than power can be geuerated by burning coal. If this be so, then all the country between Albany and the falls will be admirably adapted for manufacturing, while the Erie canal will afford cbeap and tolerably quick transportation, for there seems to be little difficulty in the way of handling these boats by electrical power.

It is announced that Corn island has been leased for fifteen years, and that the lessee intends to offer it to the United States. The island is but twenty miles from the mouth of the Nicaraguan Canal.

How Coin Is Made.

For every bar which is in the vaults of the mint at Philadelphia there is a record on the books of the superintendent. That record shows the weight and fineness of the bar. Many of the bars on storage were bought in 1890, when the Sherman law went into effect. They have remained untouched from the time when the stamp of the assayer was put on them. Now they will be taken out and melted with copper, to form an alloy.

The exact proportion of silver to copper should be nine to one, but in melting a little less than the measure of copper is used, so that by adding copper later in small quantities the alloy can be made as nearly as possible of the exact standard. It is easier to work the alloy down by adding copper than it is to work it up by adding silver.

The copper and the bar silver are put in the crucible together. The crucible for melting silver is of hand-wrought iron. These pots cost $45 each. Each of them will hold about 1000 ounces at a time. Each pot is good for 250 melts. It will cost the mint about $4500 for crucibles to melt the 42,000,000 ounces of silver.

Gold is melted in a black lead pot which costs about one-tenth as much as the iron pot, but the black lead pot is good for about only thirteen melts.

No silver passes through the iron crucible. A little is absorbed by it and this is recovered when the crucible is melted after it has seen the last of its usefulness. Nothing that could yield any of the waste silver is allowed to get away from the mint without chemical treatment to extract the precious metal. The melting pots, the slag, the ashes from the furnaces, and even the outside pickings from the black linings of the furnaces are ground and sifted to obtain metallic grains, and these grains are refined.

The residue from the sieves is put into a sweep machine, which extracts the smaller particles; and the very minute particles of metal pass in the water of the sweep machine to settling vats and wells. These wells are cleaned out at very long intervals and they always yield a little gold and silver.

Gold Mines to "Boom."

A well-informed writer in the New York *Times*, December, says in reference to the failure of the London market to respond to the success of the Government loan, that it was thought "it would considerably stimulate foreign buying," but it did not. "The fact seems to be that, while there is a quite wild bull speculation running on the other side, it is almost wholly in gold mining shares, the mines of South Africa and Western Australia. Very soon they will begin to call for American gold mining properties. It is almost inevitable. The gold fever is on them, new food to feed it will be called for, and it will be found in California, Colorado, Utah and other parts of our mining regions where the development of gold fields is progressing—progressing also with such effect that the output of gold in Colorado has been doubled. It is within the probabilities that our next bull craze here may be in gold mines, for in these matters we usually join in when London has set the pace."

ADVERTISERS should be educated to appreciate that an ad in a trade paper, reaching and read weekly or monthly by the people they wish to reach, has a value to him above merely the orders it directly brings. He does not figure the value of the sign above his door merely on the basis of the patronage it happens to attract. It is there to tell everybody who passes, whether patrons or not, where his place of business is—it is a "sign" that he is in business there. So the ad in the trade journal is a "sign" year in and out, to those you wish as patrons, that you are "still in the business."

THERE is being built in a Delaware shipyard a steamboat for the United States Government which is intended for use in the waters in the vicinity of New York in the matter of preventing the dumping of ashes and other material in navigable waters of the United States. She will be 109 feet long, 22 feet beam and 12 feet depth of hold, and will have engines of considerable power. She will also be fitted with small guns to effect the obedience of the law if it is considered necessary.

THE *Century Magazine* states that "during the year now closing a quarter of a million bicycles have been sold in this country, and that the number of riders approaches a million. There are said to be over 50,000 in New York and its neighborhood, and fully that number in and about Boston."

DOLFIN SANCHEZ, a railroad magnate of Mexico, has returned from Paris and London, where he says he was successful in securing the required amount of capital for the building of an extension of the Inter-Oceanic railroad from Chietlaw to the port of Acapulco, on the Pacific coast.

THE Senate committee on public lands has authorized a favorable report on the bill providing for a commission to examine and segregate the mineral lands in Montana and Idaho within the Northern Pacific land grant.

Scientific Progress.

The Electric Problem with Reference to Fires and Firemen.

In the current number of the *American Gas Light Journal*, Prof. G. P. Lowe has a page article with the above caption, in which he says: "A most serious phase of the electrical problem is the manner in which the erection of pole lines of aerial wires interferes with the duties of firemen. The interference is dual in its nature. It is physical in that the wires present an actual barrier which must be overcome with force and it is moral in that the men are naturally fearful of the consequences of handling circuits, the character of which they do uot understand. No one need hesitate to cut telephone, telegraph or other signal wires barehandedly, for if you receive several 'surprises' they will startle you but will do no harm. No one need expect to be killed if he cuts a trolley wire or a whole set of railway feed wires. If you stand on a ladder of dry wood and which is not metal bound, and if it is not raining and you have no connection with the earth through metal or moisture, you may hack away at the trolley wire with perfect impunity and a dull ax. In fact, it alone is as harmless as the car rail, for the trolley forms one pole of the dynamo and the car rail forms the other. So long as only one is touched at the time they are without danger. But should you, by any means, through dampness or metal become connected with the earth while handling a trolley wire, you would get a 'rap' that might double you up, or it might be so light that ample solace would be had in mild profanity. Of this, however, you may feel assured; if you are robust, no shock you may receive from a trolley circuit will of itself kill. It might knock a man from a ladder and the fall might prove fatal, or if a man had heart disease he might not survive, but I have never kuown of an instance where the 'deadly trolley' has of itself proved fatal.

"With arc lighting and altcruating current wires, both of which are operated at high pressure, it becomes a matter of no little hazard for a layman to cut them, particularly if wet. It is advisable that they should be handled only by an experienced linemau. Such wires are always hot, and not only work with each other, but each with the earth.

"With reference to fires occuring in electric light and power stations and in telephone aud telegraph offices, I beg you to most carefully consider the fact that water is almost, if not quite, as fatal to most forms of electrical apparatus as is fire and that, therefore, in combating fires in such premises the utmost discretion must be used in throwing water. The necessity for this is all the greater for the reason that the stream of water may take any pressure electric current and carry it to the nozzle-men with probably fatal results."

A New Steel-Making Process.

An Indianapolis inventor, Leopold Ianke, is reported to have discovered a new process for the conversion of iron into steel. The cast or pig iron is converted, as fast as melted from the cupola, by the force of superheated steam commingled with hot and cold air, with or without ingredients, according to the quality of the metal desired. The converter is in the form of a trough and mounted on a frame to be regulated at the front end. The trough is open at the ends and top and lined on its interior surface. The bottom of this trough appears in the form of steps inclining downward to the front. At the inside coruer of each step is a small pipe, which passes through the lining and connects with the blow-pipe chamber in the bottom of the trough. The blow-pipe chamber connects with the hot and cold air injector, and in turn from the injector passes to the reheating stove and to the boiler. The hopper is attached to the top of the converter for ingredients, aud over the middle part of the converter is a hood. Some of the advantages claimed are as follows: First, the couverter can be applied to any cupola; second, it receives the molten metal directly from the cupola, thereby dispensing with all labor as required by the Bessemer and all other processes before the metal is conveyed to the converter; third, the iron is converted without the use of ponderous blowing engines; fourth, it is converted as fast as melted, thus saving the loss of heat in the iron; fifth, the iron receives all the benefit of the commingled gases and is dissiliconized and decarbonized as desired; sixth, the apparatus can be built so conform to the size and capacity of any foundry, thus enabling the smaller foundries to make steel castings at a comparatively small expense, and lastly, a saving in cost of converting of about $3 a ton.

The Auer-Welsbach Light.

Electricity. New York, has recently published two articles on the subject of the Auer-Welsbach incandescent gas light, which is viewed as a rival of the electric light. *Electricity* admits the brilliant qualities of the light, but points out some objections to its common use, chief of which are said to be the polution of the atmosphere by the monoxide gas produced, intense heat given off, etc. The same journal has also lately printed an argument in favor of the use of gas for producing electric light in isolated buildings through the medium of gas engines and dynamo machines.

Mining Pipe!

STEEL OR IRON.—We make pipe of either, but recommend STEEL, it being superior to iron in many particulars and inferior in none.
COATING.—We use great care in COATING our pipe with a HOT solution of Double Refined Asphaltum and Maltha.
COMPETITORS.—Our competitors say we have the best appointed Pipe Shop on the Coast.

Tacoma, State of Washington, U. S. A.

DIVIDEND NOTICE.

THE GERMAN SAVINGS AND LOAN SOCIETY,
526 California Street.

For the half year ending December 31, 1894, a dividend has been declared at the rate of five (5) per cent per annum on Term Deposits, and four and one-sixth (4 1-6) per cent per annum on Ordinary Deposits, payable on and after WEDNESDAY, January 2, 1895.
GEO. TOURNY, Secretary.

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION,
532 California Street, Corner of Webb.

For the half year ending with the 31st of December, 1894, a dividend has been declared at the rate of four and eight-tenths (4 8-10) per cent per annum on Term deposits and four (4) per cent per annum on Ordinary deposits, free of taxes, payable on and after Wednesday, the 2d of January, 1895.
LOVELL WHITE, Cashier.

RUPTURE!

IT has been considered by the medical profession that hernia—commonly called rupture—was incurable, except by surgical operation, which is both dangerous to life and very rarely ever successful. But DR. J. C. ANTHONY, of 86 and 87 CHRONICLE BUILDING, has opened a new field for research, and for the past year has been making some remarkable cures. He causes the patient no pain, and those living near enough do not lose any time only while in his office once or twice weekly. He guarantees every case he treats, and does not ask a man for a dollar unless he cures him, so there can be no chance of any one being cheated. The doctor is a graduate of Bellevue Hospital Medical College, of New York City.

DEWEY & CO'S
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.
Advice and Circulars free.

DEWEY & CO., Patent Agents,
220 Market St., San Francisco.

THE JONES ROCK DRILL

IS THE

Only Successful Hand Power Drilling Machine Ever Invented.

It is strong, durable, reliable, simple, compact, light, easily handled and operated by one man, and will reduce the cost of rock drilling at least Fifty per cent.

Our handsomely illustrated pocket catalogue fully explains the features and workings of the drill. It should be in the hands of every mine owner, leaser, contractor and prospector in the West. *Sent free on application.*

If you are interested in Rock Drilling correspond with us.

WE CAN SAVE YOU MONEY.

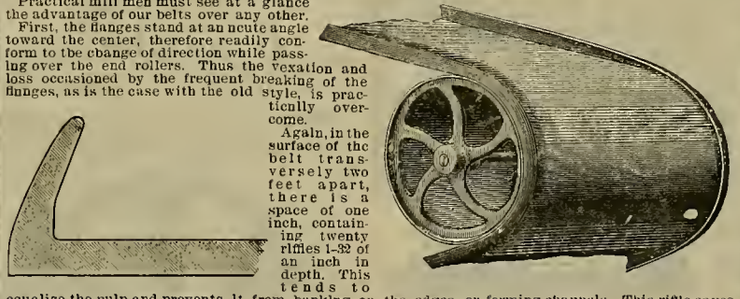
FRANK T. SUTHERLAND, M'g'r Pacific Coast Agency.

Office and Warerooms: 9 FREMONT St., San Francisco, Cal.

Or, Address the Company at its Denver Office.

Blasdel Improved Concentrating Belt.

We keep in stock belts suitable for the Frue, Triumph, Johnston and Tullock machines, and make all lengths and widths to order.



Practical mill men must see at a glance the advantage of our belts over any other. First, the flanges stand at an acute angle toward the center, therefore readily conform to the change of direction while passing over the end rollers. Thus the vexation and loss occasioned by the frequent breaking of the flanges, as is the case with the old style, is practically overcome.

Again, in the surface of the belt transversely two feet apart, there is a space of one inch, containing twenty riffles 1-32 of an inch in depth. This tends to equalize the pulp and prevents it from banking on the edges, or forming channels. This riffle saves fine sulphurets and quicksilver that would escape with the tailings from a belt with an entirely smooth surface.

H. G. BLASDEL, JR., Manager,

419 California Street, Haywards Bulldog..... San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost

Built solely by the

BUCYRUS STEAM SHOVEL AND DREDGE COMPANY,

Mechanical Progress.

Carbonic Acid Gas Gun.

In 1872 Congress gave a lump sum of $270,000 to pay for the creation of three new models of breech-loading and muzzle-loading cannon. A board of experts were appointed to attend to the business, and suggestions were invited. From all over the country were sent to Washington ideas, which were eventually published in a book by the Government. Some of them were impractical. One was for a centrifugal gun which was made to throw bullets by the turning of a wheel. The bullets were to be thrown into a hopper. Another notion was for a cannon to shoot water. This may not have been so nonsensical as it seems. Taxidermists use water cartridges to kill humming birds.

It is not safe to declare that any new idea is useless or impracticable. Recently an examiner of patents at Washington demonstrated conclusively by figures that a certain machine for which a patent was desired could not possibly work. He showed it by figures which were plain and undeniable. His surprise, then, may be imagined when the inventor brought his machine and exhibited it in actual operation, working to perfection. The notion of a gun in which carbonic acid gas is used instead of gunpowder seems absurd. Yet this invention seems likely to do wonders.

The patent was taken out not long ago in this country by Paul Giffard, a Frenchman. His idea is to compress carbonic acid gas to a liquid in a small cylinder. The cylinder may be attached to any rifle, which requires a very simple modification to adapt it for the purpose. A touch on the trigger liberates a very small quantity of the liquid carbonic acid, which instantly expands on being relieved from the pressure and drives the bullet out of the gun. Another bullet is dropped in at the breach and the operation is repeated until the cylinder is exhausted. With a single cylinder 100 bullets were fired through an inch plank at the Patent office the other day.

So long as a single drop of carbonic acid remains liquid in the cylinder, the pressure and hence the velocity imparted to the bullet is the same. A cylinder is good for 150 rounds and costs only twenty-five cents. A valve prevents the escape of more than a small quantity of carbonic acid at a time. It is expected that eventually atmospheric air compressed to a liquid will be used instead of carbonic acid gas. The pressure will then be 10,000 pounds to the square inch—more than ten times that of the carbonic acid. The velocity of the projectile will be proportionately greater. A Government could put up these cylinders in quantities, and they would be much cheaper than ordinary gunpowder cartridges. When one is used up another can be attached very quickly to the rifle.

Petroleum as a Preventive of Boiler Incrustation.

Petroleum is employed in America to prevent incrustation, and has been used for this purpose since 1875. Its value was made more fully known by comprehensive experiments at the works of the Electric Light Company in Jersey City, in 1887, and recently its use in America in this way has been extensively advocated. It must be applied in a pure state and in small quantities at a time, or it gives rise to an unpleasant smell in the boiler house. It should be allowed to enter the feed water in a uniform volume, drop by drop, in order to avoid any possible corrosion of the boiler. It is stated that the best quantity to use is from 0.8 to 1.2 pint of oil per thousand gallons of water. The action of the petroleum would appear to be that it is very rapidly dispersed in small globules through the water, and attaches itself to and dissolves the particles of lime deposited on the boiler plates. It is important that the boiler should be thoroughly scaled before the petroleum is introduced, because it attacks the existing scale, causes it to drop off, and may lead to dangerous accumulations of the deposits in the hottest parts of the boiler, and may thus entail serious superheating. It is also necessary to remember, if the oil is used to paint over the interior of the boiler, that it may lead to the production of vapors dangerous to any workman entering the same for repairs or cleansing, and the fumes may likewise cause explosions if brought in contact with a light.

As is well known, France will exercise for the fifth time what the London *Engineering* says is generally recognized as her prerogative, and in the year 1900 will hold a Universal International Exhibition after the eleven years' interval which she has fixed between each of her great exhibitions for nearly half a century. Up to the present little public interest has been aroused as to what will be a great event to usher in the new century.

A SMART YOUNG MAN

Can always get a good business situation, if qualified. The best way to qualify himself is by a course of study in an institution whose graduates require no "breaking in," but who can go right ahead and prove themselves of immediate value to their employers. Such an institution is the Pacific Business College. Write to T. A. Robinson, 320 Post St., regarding terms, etc. Business men needing competent help can be supplied free of charge.

20-Stamp Mill for Sale.

In Southern California, a 20-stamp Gold Quartz Mill, with engine, boiler, self-feeders, rock-breaker, etc.

As the premises are adjacent to Railroad, the Mill could be conveniently removed. Can be had at low price for cash. Address: "Quartz Mill," care MINING AND SCIENTIFIC PRESS, San Francisco.

The Press Clipping Bureau,

510 Montgomery street, San Francisco, deals in all kinds of newspaper information, business and personal.

UNITARIAN LITERATURE sent free by the Channing Auxiliary of the First Unitarian Church, cor. Geary and Franklin Sts., San Francisco. Address as above. Mention this paper. *

A thoroughly competent Amalgamator wants a position where mine and mill assaying is required. References given. Address Box D, this office.

Tuolumne Mining Bureau,

Sonora, Cal.

Developed and undeveloped mines for sale at lowest possible prices, for cash or bond. Correspondence and personal interviews solicited.

Practical Information.

How to Make Money in the Engine Room.

In these days of search after safe investments and every possible point of economy many manufacturers need to be reminded that the engine room is a good field for profitable investment. Of course they all believe in good engines and good boilers, or most of them do, but it is not often recognized how much there is to a steam plant besides these two main pieces.

The value of one of the minor points is brought out by *Power* in some figures which it publishes on the value of good pipe covering and the loss due to its absence.

A certain test of steam-pipe covering leads to the conclusion that it costs $15.40 to run 100 feet of naked two-inch pipe at from 70 to 80 pounds pressure for one year of 3000 working hours, with coal at $2 per ton. With the least efficient of insulating coverings used in the test this loss could be reduced to $4, with the most efficient to $2.64. Striking as are these figures, they are probably below the cost of actual practice, for a steam pipe is under pressure usually more than ten hours a day, and $2 per ton is below the average cost of coal. Prof. Charles B. Gibson, in some tests for the Manufacturers' Mutual Insurance Company, some years since, reached the conclusion that with coal at $4 per tou and 3000 working hours per year, the loss from a naked two-inch pipe was 64½ cents per linear foot—considerably more than Mr. Dickinson's test would show even with coal at $4 per ton.

As an outside cost of covering two-inch pipe with the best material may be placed at 50 cents per linear foot, these two figures given above as to annual saving—12¾ and 64½ cents per foot per aunum—show a profit on the investment of 25½ to 129 per cent. We doubt if any manufacturer can show any part of his business where a dollar is more surely or more profitably invested.

Problem In Railroading.

The big siege mortars now being put in place at Fort Point have occasioned considerable difficulty in trausportation. Even after arriving here trouble was experienced in hauling them through the city, and the commanding officer at the Presidio seemed imbued with fear that the roads there would be ruined by the transportatiou of the big dogs of war. Bringing them across the coutinent was a job. Thcy weigh 1,341,000 pounds. The mere weight was not of so much importauce, but the size of the pieces made it hard work. The ordinary railroad car is about ten feet wide, but the circles on which the motars revolvc are solid circles of cast steel, fourteen fect in diameter and two feet thick. They could not lie flat on a car, because they could not go along without jamming or knocking other cars off the track. Furthermore, there is a rule which forbids cars to be loaded higher than fourteen feet from the top of the rail. It looked at first as if it were nearly impossible. It was the Pennsylvauia road that had to do the thinking out of the scheme, for that road had the task of carrying them to Chicago. This is the way it was done:

A slot was cut in the bottom of a gondola car, such as is used for carrying coal. This was made wide enough to let in edgeways the circles which belong to each gun. Of course that weakened the car, and loug timbers had to be bolted on the floor of the car and to the cross piece in order that it would not collapse. The two circles which were to go on each car were hoisted by a steam derrick and suspended in the slot at just the right height. To tell the truth, the car was technically loaded seven inches too high, but practically there was uo violation, since the height of 14 fect 7 inches was reached at only one point in the center of the car, and no brakeman would be required to stand there. The lower rim of the axle has sufficient clearauce at the bottom—half an inch above the track level would have been enough—but about four inches was taken. The big circles were suspended at that height, while the structure that was to hold them was built of pine timbers 6x8. These were bolted with tie bolts as securely as possible.

Six cars were so arranged and the six mortars, with other gear, were loaded on ten other cars, which were not specially treated. The traiu thus carried half the load of twelve mortars on one trip. The route was on the Pennsylvania to Elizabeth over the tracks of the Central road, thence to San Francisco via the Chicago, Rock Island & Pacific, the Uniou and Central Pacific roads.

General Mining Machinery and Supplies.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Calaveras.

Herald: Rich ore is being taken from the 260-foot level of the Blair Consolidated mine, 1¼ miles from Angels. The ten-stamp mill is running night and day.

W. A. Bisbee is putting in a four-inch pump at his mine. He recently built a five stamp mill. A tunnel has been run on the Roanoke, and the intention now is to sink a shaft from that level. This mine is in a flattering condition.

W. H. Steffler & Co. are prosecuting development work on their quartz claim at German Ridge.

At the Birney mine everything is progressing in fine shape. The mill is crushing steadily and the ore is yielding good returns. Upward of twenty men are employed, and the work of further development is being pushed ahead.

Fresno.

WORKING OLD DIGGINGS.—The hard times in nearly all avenues by which the people have been accustomed to make money have caused mining to be taken up again, where it was left off many years ago. The old Pike mine, situated at the point of Burrough mountain, three miles south of the toll house, will be worked again this winter. It is a placer mine, the gold being in the soil overlying the bedrock, and the diggings were worked and abandoned almost a generation ago.

Mono.

At the Bodie Consolidated mine during the past week they have started a drift south from the upraise from west crosscut 1, 20 feet above the 400 level, on a small seam of low-grade quartz and extended the same 10 feet. West crosscut 21 from north drift from west crosscut 1 on the 300 level, was extended 8 feet; face in porphyry. Have started a drift north from old winze from main north drift, 300 level. East crosscut from Burgess winze, 50 feet below the 200 level, was extended 7 feet. In this crosscut have passed through small seams of ore. Hoisted to the surface 7 tons of ore of usual grade—$30 per ton.

Miner: The recent cleanups at the Bodie Tunnel mill have far exceeded expectations, particularly on the Bulwer. The mill has also had rock from the Noonday and Bechtel, which has also shown up well. The break in the Stanford Company's dam has been repaired, but the cold weather cuts off the water supply. The mill has been shut down for a few days, but is now running by steam power. The cyanide people are busy melting zinc for their cleanup. They will be working at this till after the first.

Plumas.

READY FOR A RUN.—*Independent:* The Quincy M. & W. Company's reservoirs, flumes and ditches having before the coming of the late storm been enlarged and otherwise put in good order for a successful run, work is suspended until the coming of water in 1895. This company has expended a large amount of money in repairing damages wrought by the elements upon their property during the time it lay idle, under the ban of an unjust law evoked by the Anti-Debris Association. To restore this property to as good condition as it was in when injunctions from the Superior Court of Sutter county paralyzed the mining industry of Plumas, an expenditure of $40,000 was required: repairs on the water ditches alone involving the purchase of over 100,000 feet of lumber. This, however, is but bagatelle to the expense of repairing tunnels through which the ditches passed on their way from the lake and other sources of water supply to the place of use. Not this alone, but in some instances new tunnels had to be driven, where those formerly in use had fallen in beyond repair. The property is now in good condition and will remain so for many years to come. We wish we could from our heart, earnestly say: God bless the Anti-Debris Association.

Santa Clara.

A NOVEL ENTERPRISE.—Carbonic acid gas—the "choke-damp" of coal miners—in an abandoned drift in a quicksilver mine at New Almaden, Santa Clara county, is being utilized. The drift was bulkheaded to prevent the escape of the gas, which is tapped by means of a pipe taken down the shaft. The gas is drawn from the pipe and forced into a large reservoir, from which portable steel cylinders are charged under a pressure of 1300 pounds to the square inch. The gas is used in soda water, and costs much less than if made in the usual way from sulphuric acid and marble dust.

Sierra.

PROSPEROUS ALLEGHANY.—*Union:* The quartz mines at Alleghany, Sierra county, are being thoroughly developed by San Francisco and Eastern capitalists, and there will be more mills erected next year, which will make that growing mining camp one of the most prosperous, as it is used to be in the early fifties, when Alleghany and Sierra City were connected by a two miles tunnel, and gold was being daily taken out by the pound from the adjacent numerous rich gravel channel and quartz ledges.

THE BALD MOUNTAIN EXTENSION.—The Bald Mountain Extension drift mine, near Forest City, Sierra county, is being successfully operated through a tunnel a mile and a quarter long by an electric plant, and regular handsome monthly dividends will soon be coming to the persistent and lucky stockholders. The aggregate yield of this valuable mining property has been more than a quarter of a million dollars. Sufficient good paying gravel is in sight to last at least a year, besides an indefinite amount undeveloped.

ALASKA.

SEVEN DOLLARS TO THE PAN.—The steamer Chilkat from Alaska brings news of gold discovery at Cook's Inlet August 10th by a party of miners arriving recently on a schooner from San Francisco. Bedrock yielded in a crude experiment $7 to the pan of dirt while nuggets worth $20 were found in profusion. C. Beatty, one of the party, reported the find in Juneau while on his way back to this city, where he will secure the latest improved appliances for obtaining gold. Thirty feet from where the first discovery was made gravel from the projecting bluff was washed and $15 in gold taken out pan after pan. The party at once filed claims to the land and several miners have gone from Juneau to the scene.

ARIZONA.

Yuma Times: A Dodge crusher and a gasoline engine were shipped for Ehrenberg yesterday on the steamer, for the Saguaro Mining Co. Hamilton Gray and two machinists went to put the machinery in place. The company is located thirty miles northeast of Ehrenberg on a cement proposition. The capacity of the crusher is twenty tons per day, the pulverized dirt being run through a dry washer. If the trial is a success large wet process works will be built.

Journal: A. Falco, head of the Gladiator Mining company, has taken a lease on the old Peck mine, and will start operations March 1st. The old workings will be cleaned out and all necessary machinery and paraphernalia put in place for working this famous property on a large scale. This mine is located about thirty miles from Prescott and eighteen years ago gave employment to hundreds of men, at which time ore was taken from the mine running from $600 to $2000 per ton silver. Litigation stopped workings and water and ruin took possession.

BRITISH COLUMBIA.

NORTHERN BELL PAYING.—The Northern Bell mine, of Jackson Basin, Kaslo district, is again on a paying basis. This mine paid fairly well up to the first of last January, when the owner turned it over to an incorporated company of $25,000 capitalization. A broker's clerk who was sent up from Puget sound to manage the property had a $7000 debt against it in less than three months, and quite a quantity of ore shipped, much of which scarcely paid transportation and reduction expenses on account of not being properly assorted. The past fall the former owner again took charge—result, on a paying basis in a short time. Such is the difference between experience and inexperience in the great industry of mining.

COLORADO.

OVER EIGHT MILLIONS.—The Leadville *Herald-Democrat*, containing a review of the work of the mines for the past year, gives the total output of the camp for 1894 as $8,160,074. If silver had been at its coinage value the output would have amounted to $13,000,000. Of the 1894 output, the production of gold amounted to $1,934,240. This, says the *Herald-Democrat*, is certainly an excellent record for a gold camp but a year old and with but three gold properties practically producing at this time. The gold output for 1893 was only a little over $803,000.

The tonnage of the camp for 1894 as given is 362,907 tons, which is an increase over 1893, when there were but 340,000 tons of ore brought to the surface. The great Smith-Moffat group, including the Maid of Erin and Gray Eagle Consolidated, has taken out 10,000 tons more than last year, and many of the other older properties show a like increase. The grand total of the yield of Leadville mines from 1879 to 1894, inclusive, is $196,449,447.29. The number of men engaged in mining, hauling and smelting ore, as furnished by the superintendents of the different mines, is divided as follows: Miners and mine laborers, 2231; smelter hands, 650; ore haulers, 150.

OREGON.

CHLORINATION A SUCCESS.—*Democrat:* W. J. Brooks, in charge of the mill and chlorination plant at the Baisley-Elkhorn mine, Baker Co., says, concerning the success of the treatment of Baisley-Elkhorn ores by chlorination, a process but recently introduced at this mine, that wonderful success had been attained. By this treatment he was saving 98¼ per cent of the metal and assays of the tailings showed that not more than $1 to the ton was being lost. This result will surprise mining men generally.

MINING DEVELOPMENTS.—The Myrtle Point Mining Company own an interest on the same lead that the Divelbiss and Salmon mountain companies are prospecting and working, and they are making openings at various croppings, and laying aside rock or ore from each development which they will have assayed and tested when they stop work for the winter. The Divelbiss mill will start up again as soon as the mill company who own the mine get their differences settled. The Salmon mountain company have found very promising ore, and will erect a mill on their property in the early spring.

MEXICO.

The *Tráfico* says that there have been discovered some very rich mines at Batuc in the district of Ures; one gambusino took out $9,000 in a month.

It is said one of the veins crossed the public road, and had been passed thousands of times, but nobody took the trouble to assay it till the other day, as it did not look as if it was worth anything till somebody assayed it out of curiosity and found it rich. There is now quite a big traffic between Torres and Batuc. Some of the fortunate owners of the new mines were lately in Guaymas and spent over $40,000 in supplies, etc.

The Amarillas mine at Minas Prietas is still in bonanza and showing up tremendously rich.

Some of the prospects in the Altar and Magdalena districts are also showing up very well.

There are quite a number of Americans mining men and other foreigners in Sonora and the *Tráfico* prophesies a mining boom.

The agricultural interests are also very prosperous, and the rivers Yaqui and Mayo are slowly developing into rich agricultural districts.

IDAHO.

CO-OPERATION NOT A SUCCESS.—The Morning mine at Mullan has closed down indefinitely, throwing out of employment over 100 men. Manager Huntley made a vigorous effort to make the co-operative plan of running a success, but failed signally to accomplish the desired result.

The Miners' union objected to the co-operative plan and appointed a committee to confer with Manager Huntley. As lessee he told the committee he could not personally afford to pay $3.50 per day with lead and silver at the present prices and he would shut down. The co-operative plan was more like contract work, and men did more for the same money. As manager he told the men he must consult the directors of the company, but from their many letters in the past few months he thought they would rather shut down than pay $3.50, for the mine never had made anything when paying that in the past. He had no objection to the men employing an expert bookkeeper, and as soon as the month's accounts were settled and returns made by the sampler for the last few cars of concentrates, they could send the expert. He thought the November accounts would be settled in time for pay-day, to-day, and he suggested that the men go back to work until that date. But the men did not go back. All day Saturday the company's office was crowded by men getting their time, and as a result the Morning mine is closed down for an indefinite period.

The Standard mine has also closed down, throwing forty men out of employment. The shut-down will doubtless last all winter. The working force from now on will be six men, who will be employed in running the lower tunnel. This also closes the Union mill at this point, which has been concentrating the Standard ore alone. Meanwhile some necessary improvements, an ore bin and other facilities for handling the ore from the lower tunnel, will be made as occasion permits.

At the present time there is no mine in the Coeur d'Alene on which so much money is being expended for improvements as the Frisco. Extensive preparations have been under way for some time for sinking from the present level in order to keep the development work well ahead of the stoping. The Frisco mine is turning out 12,000 tons of ore per month, every pound of which is weighed before concentration. There are 150 men employed in the mine and mill. A great convenience which has just been added by Manager McDonald is a telephone line running from the station to the mill. A new power house for the Pelton water wheels is also a recent improvement which has been made at considerable expense. There is no indication that the property will close down during the winter.

UTAH.

ALUMINUM.—*Tribune:* Colonel George A. Henry has returned from an extended prospecting trip through the southern portion of the Territory, and reports some remarkable finds in aluminum. It is not remarkable that aluminum should be found in any part of Utah, as aluminum clays are present in a great many sections. The discovery of Colonel Henry is not a clay, but is aluminum in the slag. That is, it lies in a deposit of volcanic matter, and nature's crucible seems to have already brought it to a condition that in manufacturing the article is only reached after three processes have been gone through. The discovery is a remarkable and important one, and conveys the hope that aluminum can be produced for a figure considerably lower than the present cost.

Samples of this deposit, of which Colonel Henry says there is an unlimited supply in sight, have been sent to the best chemists and assayers in Europe and America for tests, and some of these tests have yielded thirty-five per cent aluminum.

The discovery was made about seventy-five miles from the Detroit mining district, and in the same vicinity large deposits of coarse and fine pumice stone were found. This is also an important discovery, as nearly all the pumice stone used in the arts and manufactures is imported from Europe. Colonel Henry states that the world's supply of pumice could be taken from this deposit for many years, and no limit found to it.

Coast Industrial Notes.

—The Paraffine Paint Co. pays a 25-cent dividend to-day.

—The German Savings and Loan Society has declared a five per cent per annum dividend.

—Beginning with January 1st, the Edison Light & Power Co. announces a cut of 10% on all bills for electric lighting.

—The Simonds Saw Company has fitted out the new saw mills at Harrisburg, and at Wilbur, Or., with their inserted tooth saws.

—One and one-half million dollars is reported to have been secured for the prosecution of the railroad work near Myrtle Point, Oregon.

—The Great Northern has contracted with the Skagit Coal and Transportation Co. for 5,000 tons of Skagit county, Wash., coal per month.

—D. B. Hauson, western representative of the Edw. P. Allis Co., of Milwaukee, has sold an Allis Band Mill to the Gray's Harbor Commercial Company at Cosmopolis, Wash.

—The past twelve months made a meager year in the annals of railroad building. The total new mileage was 1919.13. Of this, Arizona contributed 193.49, and California 32.2.

—The Pacific Coast Lumber Company and the Puget Sound Shingle Company, of Tacoma, are in the hands of a receiver. The liabilities of the former will reach nearly $35,000 and the latter about $12,000.

—A Salt Lake syndicate has paid $50,000 for what is known as the "Porphyry Dyke," situated on the west side of the Klamath river, about five miles from Hornbrook, and will soon erect a large plant—a one-hundred stamp mill, it is reported.

—At the Blue Gravel mine, an ancient river system on the Klamath, 2½ miles from Hornbrook, carpenters are framing and men excavating for a ten-stamp mill, but are building with the anticipation of adding sixty or eighty stamps more, as the company own a large area of this cemented channel.

—The proposed new system of water works for Astoria, Or., will cost when completed the sum of $200,000. It will have a gravity system of eighteen inch pipe, twelve miles long, a 6,000,000 gallon reservoir, a masonry lined tunnel 1,200 feet long, an aerating foundation seventy-five feet in height, and discharging 2800 gallons a minute; also a power plant driving a dynamo for public lighting. The power is developed by the fall of the gravity system of over 600 feet.

—A big irrigation scheme in southern California is known as the Columbian Colonization Company, with a capital stock of $4,000,000. J. G. Foster, representing foreign capital, is in San Bernardino perfecting some of the minor details preliminary to beginning work on the construction of a dam at Victor, which will impound sufficient water to irrigate 350,000 acres of land. The Santa Fe road passes through the land, and the whole can be brought under cultivation at comparatively little cost. The parties interested are the principal owners of the Bear Valley Irrigation Company.

—The Elsinore Coal and Clay Co. have a great tunnel in the side of a small mountain, which is 1400 feet long. There is a six-foot vein of workable coal without any partings. There are twelve rooms in the mine now being worked. The total force employed is twenty-five men. The production is fifty tons per day, valued at from $2.50 to $3.00 per ton at the mine. The total production of the mine thus far is about 25,000 tons. The coal is a brown lignite of fair quality and is used very largely in stationary engines throughout Southern California.

—Jas. S. Brownell, western agent Frue Vanning Machine Company, reports the following sales: Imperial mine, Kennedy, Nev., four 6-ft. Frue Vanners; Grand Victory mine, El Dorado County, eight 4-ft. plain belt vanners; Gund Gold Mining Company, Toledo, O., six improved vanners; Elder mine, Candelaria, Nev., two 4-ft. plain belt vanners; East Mayflower Gold Company, Amador county, Cal., one 4-ft plain vanner; Bay State mine, Plymouth, Amador county, four 4-ft. plain belt Frue Vanners; Original Gold Quartz Mining Company, Shasta county, four 4-ft. plain belt vanners; Sierra county, Cal., one 6-ft. plain belt and one improved 4-ft. vanner; Portland, Or., 4-ft. plain belt vanner.

—The Pacific Northwest can now boast of having the longest telephone line in the world. The Sunset Telephone company has put in operation a system of lines throughout the lower Sound country as far as the mouth of the Fraser river, reaching from Seattle to New Westminster, Vancouver, points on the Fraser river as far as Ladner's Landing, Blaine, Anacortes, Fairhaven, LaConner, Marysville and intermediate points. This completes a continuous line about 1,300 miles long, beginning at Moscow, Idaho, running thence through Spokane, eastern Washington, eastern Oregon, along the Columbia river to Portland, thence through western Washington and down Puget Sound to Ladner's Landing.

—The San Francisco and Los Angeles Railroad has been incorporated again. The incorporators are: Frederick Homer, W. H. C. Fowler, W. H. Martin, W. J. Behan and A. Judson. The road is designed to run through Alameda, Contra Costa, San Joaquin, Stanislaus, Merced, Madera, Fresno, Tulare, Kern and Los Angeles counties, and will be about 500 miles in length. The capital stock is placed at $20,000,000 and $500,000 of that amount has been subscribed, ten per cent of which has been paid into the hands of the treasurer of the company, A. Judson. Mr. Homer, who has had charge of the enterprise from the start, takes $450,000 of the stock as trustee, and says that he represents Eastern capitalists who are behind the enterprise.

—Work is being rapidly pushed on the Santa Fe, Prescott & Phœnix road to Phœnix, Ariz., and it is expected to reach that point with the track by Feb. 1. Tracklaying was completed to the Hassayampi river south of Vulture Dec. 19, and the rails are being put down at the rate of over a mile a day. The grading is completed from Phœnix north seventeen miles and several miles remain to be graded. The future plans of the company include the extension of the line about 200 miles from Phœnix southeast via Florence, Tucson and Calabasas to Nogales to a connection with the Sonora railway. There will probably be built next year a branch from Congress switch west three miles to the mine of the Congress Gold company. The Vulture Mining company also proposes to build a line twelve to fifteen miles long from Vulture west to the Vulture mine, which will be a feeder to the Santa Fe Prescott & Phœnix. The road is now in operation from Ash Fork south to Martinez, 119 miles, of which all but sixty miles from Ash Fork to Prescott has been built this year. The entire line from Ash Fork to Phœnix will be 197 miles long.

Market Reports.

The Markets.

SAN FRANCISCO, Dec. 27, 1894.

Silver centers at 60, the fluctuations being slight. The whole course of the metal during the year has been downward. Twelve months ago the ruling quotation was 70. Silver mining in most instances is unprofitable even at that figure. The output has dropped from 60,000,000 ounces in '93 to 40,000,000 in '94, and unless a better average price is obtainable it is probable the silver yield in '95 will be less than 30,000,000 ounces.

According to the report of the Director of the Mint there is more money in the world than ever before. There are $3,965,900,000 in gold, $4,055,700,000 in silver, and $2,570,900,000 in uncovered paper money in present circulation. Since the publication of the last annual report there has been an increase of about $64,000,000 in the available stocks of gold money, and of about $124,000,000 in silver money, while the amount of uncovered paper money in circulation has been reduced.

The circulation per capita shows the United States well up in the list. The countries having the largest circulation are: France, $36.70; Belgium, $25.98; Netherlands, $25.68; Portugal, $25.36; the United States, $25.07; Australia, $23.36; and Greece, $20.68. The per capita circulation of the United Kingdom of Great Britain and Ireland is $19.98, and of Germany $18.78. In Bulgaria the people get along with less money per inhabitant than in any other country, eighteen cents in gold and $1.58 in silver being the figures.

The United States has in circulation $626,600,000 in gold, $625,300,000 in silver, and $475,700,000 in uncovered paper. The aggregate in this country exceeds that in any other.

New York Prices.

THE case of the Consolidated Wyoming G. M. Co. vs. the Champion M. Co., in Nevada county, which with the decisions received full mention in this paper at the time the decisions were rendered, has been finally settled by the payment of the latter company of $77,500, thus buying the property of the Wyoming Co. This was a compromise, and was looked upon as a better settlement of all legal complications between the two companies than another protracted contest in appellate courts.

Mining Share Market.

SAN FRANCISCO, Dec. 27, 1894.

The closing week of the year has brought no change on the street. Through '94 there has been more activity in the workings of the mines than in the workings of the stocks; and when the fact is taken in considcration that the paying mines are not listed, nor their stock for sale, the contrast is still more manifest.

The following illustrates the changes of the week:

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DECEMBER 18, 1894.

531,009.—CAR COUPLING—J. Clark, Hartland, Wasb.

531,022.—DISPLAY RACK—W. H. Conrad, Pasadena, Cal.

530,987.—INDEX—J. A. Fiscber, S. F.

531,172.—HARNESS—W. A. Fleming, S. F.

531,178.—HARP LOCK—F. A. Getze, Los Angeles, Cal.

531,045.—LAVATORY APPARATUS—D. Kstas, Seattle, Wasb.

531,003.—TRUNK—K. S. O'Keefs, S. F.

531,050.—SEWING MACHINE—F. O'Neill, Redlands, Cal.

531,132.—MAGAZINE GUN—W. H. Ostrander, S. F.

531,005.—ELECTRIC CONVERTER—F C. Priestly, S. F.

531,006.—DYNAMOMETER—R. J. Rolfson, S. F.

531,134.—FIRE-PROOF BUILDING—J. W. Rowell, S. F.

531,068.—ORE CRUSHER—A. H. Scbierbolz, S. F.

531,231.—FARE REGISTER—E. T. Taylor. Oakland, Cal.

531,232.—SUSPENSORY—John Teuscher, Jr., Bridal Veil, Or.

531,074.—CENTRIFUGAL PUMP—M. Wagner, Tacoma, Wasb.

NOTE.—Copies of U. S. and Foreign patents furnisbed by Dewey & Co. in the sbortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MAGAZINE GUN.—W. H. Ostrander, San Francisco. No. 531,132. Dated Dec. 18, 1894. This invention relates to improvements in magazine guns, and it is especially applicable to that class of magazine guns or repeaters having two barrels upon a single stock like a shotgun, with magazines heneath and mechanism wherehy supplemental cartridges carried in these magazines may he elevated and introduced into the barrels after the previous cartridges have heen discharged therefrom. The barrels are slidahle upon the fore end and an intermediate mechanism consisting of slidahle racks, movable with the harrels and pinions engaged by the racks, actuate carriers hy which the cartridges are lifted from the magazine to a position opposite the open rear end of the harrel; means for disengaging either pinion so as to allow one mechanism to he actuated independently when hut one barrel is to he recharged; connecting mechanism by which the hammers are retracted and the gun placed in position for firing, and locking devices hy which the safety of the gun is assured when it is not in actual use.

FARE REGISTER.—Edward T. Taylor, Oakland, Cal. No. 531,281. Dated Dec. 18, 1894. This invention relates to a device for registering fares collected, and is especially adapted for use upon street cars and similar conveyances. It consists of a registering device comprising toothed disks of different diameters journaled to turn ahout a common center post, the outer disk having its peripheral rim thickened so that its face is approximately in the same plane with the face of the inner disk, figures made upon the faces and near the peripheries of these disks corresponding with the number of teeth therein; a pawl mechanism whereby the outer disk is advanced tooth by tooth until a single rotation is completed; a radially slidable plate, the outer end of which is adapted to register with the final notch of the outer disk, and a pawl on said plate adapted to engage the inner disk, whereby the inner disk is advanced one tooth at the completion of each rotation of the outer disk; a dial having its face, near the periphery, marked to correspond with the teeth of the outer disk, and slots made in one side on a horizontal line with the center through which one line of figures upon the two disks is exposed simultaneously, and an index hand or pointer movable over the dial in unison with the movement of the outer disk.

Silver King M Co, Nev	J W Pew, 310 Pine.	Jan 8

Why the Accidents Happen.

H. C. Acker, Colorado State Inspector of metalliferous mines, has made his official report to Governor Waite for the past two years. The report gives the following recapitulation of the condition of mining labor in that State: Number of miners working, 16,794; mines visited, 985; number of visits, 1,232; fatal accidents, 50; non-fatal accidents, 100; miles traveled, 34,287. On the subject of accidents and their prevention Mr. Acker says:

"Many accidents have been caused by attempts to drill out loaded holes which have failed to explode; deficient cages have caused others; tamping loaded holes with metal bars has contributed its quota to the death list, and it has happened that weak timbers were responsible for deaths because they were set by an incompetent man.

"Generally speaking, mine owners have shown a commendable disposition to promptly comply with all reasonable regulations having in view the safety and protection of the men in their employ. The law providing for the inspection of metalliferous mines has for its main object the protection of the lives of the most numerous class of our wage-workers engaged in what is perhaps the most hazardous of all occupations. Skilled miners know these dangers and generally do their best to avoid them, but incompetent men sometimes employed at lower wages not only endanger themselves, but often cause the loss of the lives and property of others.

"To obviate these direful results, and in view of the fact that druggists and plumhers are required by state law to fit themselves by study and experience to fulfill their duties with safety to their fellowmen, miners should he required to give some evidences of their qualifications hefore being employed. Corporate owners should also he compelled to see that foremen and those directly in charge of bodies of men engaged in so hazardous an employment as mining are competent to carefully care for the safety of the men under them."

He also recommends that no giant powder be stored within 100 feet of the mouth of the shaft or tunnel, and the adoption of an eight-hour law for miners.

A Word With Advertisers.

Change your advertisements regularly. Don't regard your spaee in the paper as a sign to be simply glaneed at, but, rather, as a plaee where you ean tell your eustomers and friends what you have for sale. Let them know what you make a specialty of from time to time. Make your advertisements readable and buyers will read them. Don't forget that a neat little engraving always attraets attention to the body of the advertisement. Again, don't try to print a whole catalogue in a two-ineh spaee. It's the white paper between the lines that makes an advertisement readable, not the amount of information you may try to crowd in. And don't insist on your name being printed in the largest and blaekest type that can be found. Tell your friends what you have for sale in a few well-ehosen words, and they will notiee your name no matter how small the type used.—West Coast Lumberman.

"Ore Deposits of the United States."

The second edition of this work by J. F. Kemp, revised and enlarged, is received. The book is rewritten throughout. The subjeet is a vast one, and where so much regarding theory and practice has been published, it sometimes happens that what is good is not new, and what is new is not good. In this instance, however, every one of the 328 pages is replete with up-to-date information of a praetical nature, with just enough theory to make it interesting. Assuming at the outset on the part of the reader some slight aequaintanee with geology and mineralogy, the author has eondensed the researehes of reeent investigators, and where not original, an elaborate system of references gives in every instance the source of his statements.

The matter of origin and formation, struetural features of ore veins, classifieation of deposits, ete., are diseussed intelligently and the several sections of the country with their principal ores given eareful notation.

The eondensed nature of the work makes it more a text-book, or volume of referenee, than more voluminous writings on the same subjeet, this idea being elearly one of the purposes of the author. The work contains nearly 100 illustrations and is well gotten up typographieally. It is issued by the Scientific Publishing Co., 253 Broadway, N. Y. Priee, $4.

"THE ANNUAL REPORT of the Smithsonian Institute for the year ending June 30, 1893," is reeeived, an elaborate work of nearly 800 pages. It is replete with authentic seientific information, and is handsomely illustrated. Most of the eontents are reprint. About the most interesting article is "Fundamental Units of Measure," by Prof. T. C. Mendenhall. "The Wanderings of the North Pole," by Sir Robt. Ball, is also a notable eontribution.

Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.

It is the ahlest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the hest knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.

Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

Practical Treatise on Hydraulic Mining.

BY AUG. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dumps; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, $5, postpaid For sale by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

The Mineral Hydrocarbons.

Their History, Geography, Geology, Physical and Chemical Properties and Uses.

NUMBER XVII.

Written for the MINING AND SCIENTIFIC PRESS and copyrighted 1894, by Henry G. Hanks, F. G. S.

We will consider the oil wells in the order of the number by which they are designated on the map (published with the report).

No. 1 is a well thirty feet in diameter full of tarry oil, boiling with the escape of marsh gas. It is situated in the midst of a gentle slope, forming part of a terrace or plain situated at least 1000 feet above the sea. The plain, which is one and one-quarter miles long by three-fourths of a mile wide, appears to have been formed by the long accumulation of asphaltum from the evaporation of the overflow of this great oil spring. The depth of this great mass of asphaltum is, of course, a matter of conjecture, as no explorations have been made upon it; but it is probably safe to estimate its contents on a mile square at one yard in depth, which would give over three million cubic yards of fuel, from which a good coke is readily prepared, or which is even by distillation capable of yielding a large return of oil. Over this area there are several minor points of tarry overflow, but we consider the whole one great oil spring. * * *

I learn from Mr. George S. Gilbert, who had a small refinery near by, on both the east and west ends of the oil range, that the petroleum of the great spring now under consideration gave a very large yield of oil. The same person is my authority for the statement that asphaltum in a very poor and ill-suited set of D. retorts yielded fifty gallons of oil to the ton.

No. 2 is a series with numerous openings in the face of the first table or terrace, about 75 or 100 feet above the Sisaw, and discharging into the valley of that stream. These openings plainly belong to one fissure or eropping at a considerably lower level than the great basin before deseribed. Some thin oil is seen percolating from these outcrops.

No. 3 is an area of asphaltum three-quarters of a mile long by half a mile in width, exuding tar and rock oil at very numerous points, especially along the arroyo. In position it is a little above the great lagoon No. 1.

No. 4 is a beautiful spring of oil and thin tar. This is a large and fine spring showing more oil than either of the other outcrops.

No. 5 is a small, well-defined spring of thick oil. The oil produced by these last two springs was found in Mr. Gilbert's experiments, as he assures me, of superior quality, he esteeming them equal to any in the region for the value of their products.

No. 6 is a distinct group of outcrops of thin tar, north of the Lione branch of the San Antonio creek.

These are all the outcrops of which I made notes. The whole development is amazing, and it is plain to the least instructed person that the amount of oil capable of being produced here is almost without limit. Even without artesian wells, using the coke of the asphalt as fuel and the asphalt itself as material, a vast quantity of oil can be distilled, while the natural flow of the several springs, if concentrated simply by open cuts and ditches and conducted to covered tanks, must produce a considerable amount daily. Compared to the original show on Oil creek, in Pennsylvania, the outcrops on Rancho Ojai are truly surprising.

Although on the maps the outcrops are limited by six groups numerically considered, they certainly exceed twenty places of discharge, and at least as many more where oil has flowed in former times, but where now only solid moss-grown rocks of asphaltum attest its former activity.

In the description of the great spring marked No. 1 on the map, it is stated that the deposit of asphaltum produced from the former overflow of the spring is probably one yard thick and one mile square, expressly stating that the thickness (not the area) is conjectural. To show those not accustomed to contemplate the enormous products resulting from the combination of a few simple measurements, when applied to such large units as a square mile, let us observe that in the 640 acres contained in one square mile there are in one yard in depth 3,400,000 cubic yards. Granting that the density of the asphaltum is only one (specific gravity 1), water being unity (it is in fact 1.2 or thereabout), it appears that each cubic yard of this fossil fuel weighs in round numbers 1700 pounds; but $3,400,000 \times 1700 = 5,780,000,000$ pounds, or 2,890,000 tons. If each ton yields 50 gallons of oil, the product of this large quantity of asphaltum turned into oil would be 144,500,000 gallons, and an amount of coke which will correspond to at least one-third of the original weight of the asphaltum. If an effort is made to estimate the money value of these products, calling the coke nothing, it will be found to reach a figure almost fabulous.

(To be Continued.)

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by the hydraulic process from Mello & Costa, in the Spring Valley mine, near Cherokee, Butte Co., to deposit tailings on flat ground; from H. E. Pickett, in the Kentucky Flat mine, near Georgetown, El Dorado Co., to deposit tailings behind a dam in North Otto creek; from Wm. Johnson, in his mine near Volcano, Amador Co., to deposit tailings behind a dam in Clapboard gulch; from El Dorado Water and Deep Gravel Mining Co., in the Henrietta mine, near Placerville, El Dorado Co., to deposit tailings behind a dam in a dry ravine; from Leroy Hedge, in his mine near Brownsville, Yuba Co., to deposit tailings behind a dam in a ravine; from Rolland & Vanderburg, in the Epley mine, near Placerville, El Dorado Co., to deposit tailings behind a dam in a ravine; from the York Mining Co., in its mine near Brownsville, Yuba Co., to deposit tailings behind a dam in a ravine; from Hancock & Daly, in the Last Chance mine, near Placerville, El Dorado Co., to deposit tailings behind a dam in a ravine; from Goodman Bros. and Goodman & Bund, in their mines near Volcano, Amador Co., to deposit tailings behind a dam in Ashland creek; from Hadley & Bolles, in the 49 Flat mine, near Volcano, Amador Co., to impound tailings behind a dam in 49 gulch; and from G. A. Melnecke et al., in the Fine Gold mine, near Vallicita, Calaveras Co., to impound tailings behind dams in a dry ravine, gives notice that a meeting will be held at Room No. 92, Flood Building, San Francisco, Cal., on Jan. 14, 1895, at 1:30 P. M.

The Explorers' and Assayers' Companion.

A Third Edition of Selected Portions of the "Explorers', Miners' and Metallurgists' Companion."

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay has been kept as free from formulæ as possible. The work is written for practical men, and all the explanations and discriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Price $6.00 postpaid. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

ACTUAL BUSINESS PRACTICE.

Established 1863. PACIFIC Business College, 320 POST ST. SAN FRANCISCO. Day and Evening Sessions.

Rates of Tuition Very Moderate.

Bookkeeping, Penmanship, Shorthand, Typewriting, English Branches, etc. Graduates aided in getting positions. Send for circulars. T. A. ROBINSON, President.

Gold and Silver Mining Claims,

Near Needles and Two R. R. Stations,
FOR SALE OR EXCHANGE.

Mill returns show up to $30 in gold and over $115 in silver per ton. House, materials, tools, etc.; no plant. Sell cheap to close the estate of late owner, or exchange for acreage or city property in South California. J. B. BAINBRIDGE, 230 West First St., Los Angeles, Cal.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals Without Quicksilver. By GUIDO KUSTEL, M. E.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, $3, postpaid. For sale by THE DEWEY PUBLISHING CO., 220 Market St., San Francisco.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, $3. Sold by THE MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for $3 per volume of six months. Per year (two volumes), $5. Inserted in Dewey's patent binder, 50 cents additional per volume.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—GOLD AND SILVER ORES.

SECOND EDITION—PRICE $1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist or the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents: Preface; Introduction; Implements; Assay Balances; Materials; The Assay Office; Preparation of the Ore; Weighing the Charges; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorification; Cupellation; Weighing the Bead; Parting; Calculating the Assays; Assay of Ore Containing Coarse Metals; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

Parts II and III.—Gold and Silver Buttion, Lead, Copper, Tin, Etc.

SECOND EDITION—PRICE $1.75.

This book is entitled "Assaying—Parts II and III," and is separate from part I, and treats of Gold and Silver Buillion, Lead, Copper, Tin, Mercury, Zinc, Nickle, Cobalt, etc.

Table of Contents—Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickle and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc.

The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, $1.75. Sold by the Mining and Scientific Press, 220 Market St., San Francisco.

SITUATION WANTED BY ENGINEER AND machinist who understands the running and care of electric plants. Engagement preferred with parties interested in the use of electricity for the reduction of refractory ores. WM. H. RUE, 242½ 12th St., San Francisco, Cal.
